## ACTOnco® + Report

PATIENT	
Identifier: 吳承恩	Patient ID: 46014566
Date of Birth: May 15, 1981	Gender: Male
Diagnosis: Colon adenocarcinoma	
ORDERING PHYSICIAN	
Name: 陳明晃醫師	Tel: 886-228712121
Facility: 臺北榮總	
Address: 臺北市北投區石牌路二段 201 號	
SPECIMEN	
Specimen ID: S11175525B Collection site: Lung	Type: FFPE tissue
Date received: Apr 10, 2023 Lab ID: AA-23-02011	D/ID: NA

#### ABOUT ACTORCO®+

The test is a next-generation sequencing (NGS)-based assay developed for efficient and comprehensive genomic profiling of cancers. This test interrogates coding regions of 440 genes associated with cancer treatment, prognosis and diagnosis. Genetic mutations detected by this test include small-scale mutations like single nucleotide variants (SNVs), small insertions and deletions (InDels) (≤ 15 nucleotides) and large-scale genomic alterations like copy number alterations (CNAs). The test also includes an RNA test, detecting fusion transcripts of 13 genes.

### SUMMARY FOR ACTIONABLE VARIANTS

### VARIANTS/BIOMARKERS WITH EVIDENCE OF CLINICAL SIGNIFICANCE

Genomic	Probable Effects in Patient's Cancer Type		Probable Sensitive in Other
Alterations/Biomarkers	Sensitive	Resistant	Cancer Types
KRAS G13D	-	Cetuximab, Panitumumab	-

### VARIANTS/BIOMARKERS WITH POTENTIAL CLINICAL SIGNIFICANCE

Genomic Alterations/Biomarkers	Possibly Sensitive	Possibly Resistant
AKT1 E17K	Everolimus	Cetuximab
FBXW7 R479Q	Everolimus, Temsirolimus	Gefitinib, Regorafenib

#### Note:

- The above summary tables present genomic variants and biomarkers based on the three-tiered approach proposed by US FDA for reporting tumor profiling NGS testing. "Variants/biomarkers with evidence of clinical significance" refers to mutations that are widely recognized as standard-of-care biomarkers (FDA level 2/AMP tier 1). "Variants/biomarkers with potential clinical significance" refers to mutations that are not included in the standard of care but are informational for clinicians, which are commonly biomarkers used as inclusion criterial for clinical trials (FDA level 3/AMP tier 2).
- The therapeutic agents and possible effects to a given drug are based on mapping the variants/biomarkers with ACT Genomics clinical knowledge database. The mapping results only provide information for reference, but not medical recommendation.
- Please refer to corresponding sections for more detailed information about genomic alteration and clinical relevance listed above.

行動基因僅提供技術檢測服務及檢測報告,檢測結果之臨床解釋及相關醫療處置,請諮詢專業醫師。報告結果僅對此試驗件有效。 行動基因臨床分子醫學實驗室 台北市內湖區新湖二路345號3F

## ACTOnco® + Report

## **TESTING RESULTS**

## **VARIANT(S) WITH CLINICAL RELEVANCE**

## - Single Nucleotide and Small InDel Variants

Gene	Amino Acid Change	Allele Frequency
AKT1	E17K	13.3%
APC	L533fs	31.0%
FBXW7	R479Q	12.6%
KRAS	G13D	28.8%

### - Copy Number Alterations

Chromosome	Gene	Variation	Copy Number
	Not	detected	

### - Fusions

Fusion Gene & Exon	Transcript ID
	No fusion gene detected in this sample

## - Immune Checkpoint Inhibitor (ICI) Related Biomarkers

Biomarker	Results
Tumor Mutational Burden (TMB)	5.7 muts/Mb
Microsatellite Instability (MSI)	Microsatellite stable (MSS)

#### Note:

- Variant(s) enlisted in the SNV table may currently exhibit no relevance to treatment response prediction. Please refer to INTERPRETATION for more biological information and/or potential clinical impacts of the variants.
- Loss of heterozygosity (LOH) information was used to infer tumor cellularity. Copy number alteration in the tumor was determined based on 50% tumor purity.
- TMB was calculated by using the sequenced regions of ACTOnco®+ to estimate the number of somatic nonsynonymous mutations per megabase of all protein-coding genes (whole exome). The threshold for high mutation load is set at ≥ 7.5 mutations per megabase. TMB, microsatellite status and gene copy number deletion cannot be determined if calculated tumor purity is < 30%.

## ACTOnco® + Report

## THERAPEUTIC IMPLICATIONS

### **TARGETED THERAPIES**

Genomic Alterations	Therapies	Effect	
Level 1			
KRAS G13D	Cetuximab, Panitumumab	resistant	
Level 3B			
<b>AKT1</b> E17K	Everolimus	sensitive	
Level 4			
<b>FBXW7</b> R479Q	Everolimus, Temsirolimus	sensitive	
<b>AKT1</b> E17K	Cetuximab	resistant	
<b>FBXW7</b> R479Q	Gefitinib, Regorafenib	resistant	

Therapies associated with benefit or lack of benefit are based on biomarkers detected in this tumor and published evidence in professional guidelines or peer-reviewed journals.

Level	Description
1	FDA-recognized biomarkers predictive of response or resistance to FDA approved drugs in this indication
2	Standard care biomarkers (recommended by the NCCN guideline) predictive of response or resistance to FDA approved drugs in this indication
ЗА	Biomarkers predictive of response or resistance to therapies approved by the FDA or NCCN guideline in a different cancer type
3B	Biomarkers that serve as inclusion criteria for clinical trials (minimal supportive data required)
4	Biomarkers that show plausible therapeutic significance based on small studies, few case reports, or preclinical studies

AG4-QP4001-02(07)

行動基因僅提供技術檢測服務及檢測報告,檢測結果之臨床解釋及相關醫療處置,請諮詢專業醫師。報告結果僅對此試驗件有效。 行動基因臨床分子醫學實驗室 台北市內湖區新湖二路345號3F Email: service@actgenomics.com T: +886-2-2795-3660 F: +886-2-2795-5016

ACTOnco® + Report

## **IMMUNE CHECKPOINT INHIBITORS (ICIs)**

No genomic alterations detected to confer sensitivity or lack of benefit to immune checkpoint therapies.

#### - Other Biomarkers with Potential Clinical Effects for ICIs

Genomic Alterations	Potential Clinical Effects
	Not detected

Note: Tumor non-genomic factors, such as patient germline genetics, PDL1 expression, tumor microenvironment, epigenetic alterations or other factors not provided by this test may affect ICI response.

### **CHEMOTHERAPIES**

No genomic alterations detected in this tumor predicted to confer sensitivity or lack of benefit to chemotherapies.

#### **HORMONAL THERAPIES**

No genomic alterations detected in this tumor predicted to confer sensitivity or lack of benefit to hormonal therapies.

### **OTHERS**

No genomic alterations detected in this tumor predicted to confer sensitivity or lack of benefit to other therapies.

#### Note:

Therapeutic implications provided in the test are based solely on the panel of 440 genes sequenced. Therefore, alterations in genes not covered in this panel, epigenetic and post-transcriptional and post-translational factors may also determine a patient's response to therapies. In addition, several other patient-associated clinical factors, including but not limited to, prior lines of therapies received, dosage and combinations with other therapeutic agents, patient's cancer types, sub-types, and/or stages, may also determine the patient's clinical response to therapies.

行動基因僅提供技術檢測服務及檢測報告,檢測結果之臨床解釋及相關醫療處置,請諮詢專業醫師。報告結果僅對此試驗件有效。 行動基因臨床分子醫學實驗室 台北市內湖區新湖二路345號3F Email: service@actgenomics.com T: +886-2-2795-3660 F: +886-2-2795-5016

AG4-QP4001-02(07) page 4 of 21

## VARIANT INTERPRETATION

### **AKT1** E17K

### **Biological Impact**

The v-akt murine thymoma viral oncogene homolog 1 (AKT1, also known as protein kinase B) gene encodes gene encodes an AKT family of serine/threonine protein kinases, including AKT2 and AKT3 isoforms, that act as a downstream effector of the pro-oncogenic PI3-kinase signaling pathway[1]. AKT plays an essential role in cell survival, growth, migration, proliferation, polarity, metabolism (lipid and glucose), cell cycle progression, angiogenesis, muscle and cardiomyocyte contractility and self-renewal of stem cells[2]. AKT1 regulates cell proliferation and survival through PI3K signaling and is frequently hyperactivated in cancer<sup>[3]</sup>.

AKT1 E17K lies within the PH domain of the AKT1 protein (UniProtKB). E17K is considered as a gain-of-function mutation which leads to constitutive AKT1 activation. Besides, it also promotes downstream signaling and transforming activity in vitro [4][5]. AKT1 E17K was identified in different tumor types such as colon, lung, uterus, and mostly in breast<sup>[6][7]</sup>.

### Therapeutic and prognostic relevance

BOLERO-1 and -3 trials have demonstrated that HER2-positive breast cancer patients with hyperactive PI3K pathway (low PTEN or known PIK3CA or AKT1 E17K mutation) benefited from everolimus than those without PI3K pathway activation[8]. In addition, AKT1 has been determined as an inclusion criterion for the trials evaluating everolimus efficacy in breast carcinoma (NCT03805399), prostate cancer (NCT03580239), and malignant solid tumors (NCT01827384, NCT04591431).

In the phase I trial (NCT01226316), several heavily pretreated cancer patients (including endometrial, lung adenocarcinoma, cervical and breast cancer) harboring AKT1 E17K demonstrated partial response when treated with capivasertib (AZD5363, a AKT inhibitor)[7](DOI: 10.1158/2159-8290.CD-NB2018-153). The dynamic change of AKT1 E17K in cfDNA was also monitored and exhibited significantly reduced after capivasertib treatment[7]. Of note, one heavily-treated endometrioid ovarian cancer patient harboring AKT1 E17K had a sustained partial response to capivasertib for more than two years (NCT01353781)[9].

Results from a retrospective study showed that colorectal carcinoma (CRC) patients harboring an AKT1 E17K mutation and wild-type KRAS/BRAF were resistant to cetuximab in combination with irinotecan[10].

## APC L533fs

### **Biological Impact**

APC (adenomatous polyposis coli) gene encodes a negative regulator of the WNT/β-catenin signaling pathway. It binds to β-catenin, leading to its degradation and subsequently inhibits transcriptional activation[11]. APC is also associated with cell migration and adhesion, apoptosis, and DNA repair[12][13]. APC mutations are commonly observed in colorectal cancer and are also reported in lung, breast, prostate, uterine, skin, bladder, stomach and head and neck cancers (cBioPortal, MSKCC, April 2015).

L533fs mutation results in a change in the amino acid sequence beginning at 533, likely to cause premature truncation of the functional APC protein (UniProtKB). This mutation is predicted to lead to a loss of APC protein function, despite not being characterized in the literature.

### Therapeutic and prognostic relevance

A study of colorectal cancer patients (n= 468) indicated that MSS tumors without any APC mutation carry a worse prognosis than single APC mutation tumors. However, tumors with two APC, KRAS, and TP53 mutations confer the poorest survival among all the subgroups examined<sup>[14]</sup>.

## ACTOnco® + Report

### **FBXW7 R479Q**

### **Biological Impact**

The F-box/WD repeat-containing protein 7 (FBXW7) gene encodes a protein that belongs to the SCF (SKP1-CUL1-F-box protein) E3 ligase complex. FBXW7 is recognized as a tumor suppressor which is involved in the negative regulation of oncogenes such as c-Myc<sup>[15][16]</sup>, c-Jun<sup>[17]</sup>, cyclin E<sup>[18]</sup>, Notch family members<sup>[19][20]</sup>, Aurora-A<sup>[21]</sup>, mTOR<sup>[22]</sup>, KLF5<sup>[23]</sup>, and MCL-1<sup>[24]</sup>. Inactivating FBXW7 mutation or copy number loss may result in the accumulation of oncoproteins and therefore lead to malignant transformation<sup>[25]</sup>. FBXW7 is a haploinsufficient tumor suppressor gene with one copy loss may lead to weak protein expression and is insufficient to execute its original physiological functions<sup>[23][24][26]</sup>.

FBXW7 R479Q is a missense mutation lies within the WD repeat 3 of the FBW7 protein (UniProtKB). FBW7 R479Q was demonstrated as a loss-of-function mutant which is defective in NOTCH binding, leading to the stabilization of NOTCH1 and MYC proteins and contribute to the transformation in leukemias<sup>[27]</sup>.

#### Therapeutic and prognostic relevance

Clinical efficacy of mTOR inhibitors was seen in patients harboring aberrations in the FBXW7 gene (one patient with refractory fibrolamellar hepatocellular carcinoma, and one patient with lung adenocarcinoma)<sup>[28][29]</sup>. Moreover, in vitro assay also suggested that loss or inactivation of FBXW7 may confer sensitivity to mTOR inhibitor<sup>[22]</sup>.

Preclinical studies suggested that mutations or loss of FBXW7 were associated with regorafenib and oxaliplatin resistance in CRC cell lines and gefitinib resistance in lung cancer cells<sup>[30][31][32][33]</sup>.

Retrospective studies have indicated that a relatively low expression level of FBXW7 is an independent prognostic marker of poor survival for patients with hepatocellular carcinoma, lung adenocarcinoma and squamous cell carcinoma<sup>[34][32]</sup>.

A retrospective study showed that patients with colorectal cancer and harbored FBXW7 hotspot mutations like R465H, R465C, and R479Q have higher 5-year overall survival rate when compared with patients carrying other FBXW7 mutant types<sup>[35]</sup>.

## KRAS G13D

### **Biological Impact**

The V-Ki-Ras2 Kirsten Rat Sarcoma 2 Viral Oncogene Homolog (KRAS) gene encodes a small GTPase protein, a member of the RAS family of small GTPases, which catalyze the hydrolysis of GTP to GDP. RAS proteins cycle between an active (GTP-bound) and an inactive (GDP-bound) state, to activate the downstream oncogenic pathways, including the PI3K/AKT/mTOR and MAPK pathways<sup>[36]</sup>. KRAS mutations occur primarily in three hotspots G12, G13 and Q61, and less frequently in codon A146<sup>[36][37]</sup>. These are activating mutations that lead to constitutive activation and persistent stimulation of the downstream signaling pathways<sup>[38][39]</sup>. Mutations in KRAS have been reported in a diverse spectrum of human malignancies, including pancreatic carcinomas (>80%)<sup>[36][40]</sup>, colon carcinomas (40-50%)<sup>[41][42]</sup>, and lung carcinomas (30-50%)<sup>[43][44]</sup>, but are also present in biliary tract malignancies, endometrial cancer, cervical cancer, bladder cancer, liver cancer, myeloid leukemia and breast cancer<sup>[37]</sup>.

KRAS G13D is a hotspot mutation which lies within the GTP-binding region of the KRAS protein (UniProtKB). G13D mutation results in decreased KRAS GTPase activity<sup>[45]</sup> and induces cell transformation in vitro<sup>[46]</sup>.

#### Therapeutic and prognostic relevance

Cetuximab and panitumumab are FDA-approved for treating RAS wild-type metastatic colorectal cancer. The NCCN for CRC recommends cetuximab and panitumumab use only if both KRAS and NRAS genes are normal.

## ACTOnco® + Report

KRAS mutation has been determined as an inclusion criterion for the trials evaluating MEK inhibitors efficacies in various types of solid tumors (NCT03704688, NCT02399943, NCT02285439, NCT03637491, NCT04214418).

KRAS mutations are associated with a lack of efficacy of EGFR TKIs<sup>[47][48][49]</sup>. Some case reports suggest that MEK inhibitors may benefit patients with KRAS mutations, as shown in cervical and ovarian cancer cases (Am J Clin Exp Obstet Gynecol 2015;2(3):140-143)<sup>[50][51]</sup>. However, a randomized Phase II study did not find trametinib to be superior to docetaxel in KRAS-mutant non-small cell lung cancer patients<sup>[52]</sup>. MEK inhibitors as a monotherapy have limited response<sup>[53]</sup>.

Combining MEK and mTOR inhibitors is being evaluated as a potential strategy in RAS-mutant CRC<sup>[54][55]</sup>. The combination of trametinib and palbociclib has resulted in objective responses in KRAS mutant models<sup>[56]</sup>.

Sorafenib has been shown to be beneficial in KRAS-mutant CRC/NSCLC, and KRAS-amplified melanoma<sup>[57][58][59]</sup>. KRAS mutations in exon 2 (codon 12 or 13) and codon 61 have been associated with poor prognosis in CRC<sup>[60]</sup>.

Patients with KRAS or BRAF mutations in low-grade serous carcinoma of the ovary or peritoneum had better overall survival than those with wild-type genes<sup>[61]</sup>. In ovarian serous borderline tumor, KRAS G12V mutation was linked to shorter survival time<sup>[62]</sup>.

## ACTOnco® + Report

## **US FDA-APPROVED DRUG(S)**

## **Everolimus (AFINITOR)**

Everolimus, a derivative of sirolimus, works as an inhibitor of mammalian target of rapamycin complex 1 (mTORC1) and blocks mTORC1-mediated downstream signals for cell growth, proliferation, and survival. Everolimus is developed and marketed by Novartis under the trade name AFINITOR.

## - FDA Approval Summary of Everolimus (AFINITOR)

RADIANT-4 <sup>[63]</sup>	Lung or gastrointestinal neuroendocrine tumor (Approved on 2016/02/26)
NCT01524783	
NC101324763	Everolimus vs. Placebo [PFS(M): 11 vs. 3.9]
BOLERO-2 <sup>[64]</sup>	Breast cancer (Approved on 2012/07/20)
NCT00863655	ER+/HER2-
NC100603033	Everolimus + exemestane vs. Placebo + exemestane [PFS(M): 7.8 vs. 3.2]
EXIST-2	<b>Tuberous sclerosis complex (tsc)-associated renal angiomyolipoma</b> (Approved on 2012/04/26)
NCT00790400	
	Everolimus vs. Placebo [ORR(%): 41.8 vs. 0]
DADIANT (65)	Pancreatic neuroendocrine tumor (Approved on 2011/05/05)
RADIANT-3 <sup>[65]</sup>	
NCT00510068	Everolimus vs. Placebo [PFS(M): 11 vs. 4.6]
EXIST-1 <sup>[66]</sup>	Subependymal giant cell astrocytoma (Approved on 2010/10/29)
	-
NCT00789828	Everolimus vs. Placebo [ORR(%): 35.0]
DECODD 4[67]	Renal cell carcinoma (Approved on 2009/05/30)
RECORD-1 <sup>[67]</sup>	-
NCT00410124	Everolimus vs. Placebo [PFS(M): 4.9 vs. 1.9]

## **Temsirolimus (TORISEL)**

Temsirolimus is a soluble ester of sirolimus (rapamycin, brand-name drug Rapamune) and functions as an inhibitor of mammalian target of rapamycin complex (mTORC). The inhibitory molecular mechanism is similar to Everolimus. Temsirolimus is developed by Wyeth Pharmaceuticals and marketed by Pfizer under the trade name TORISEL.

### - FDA Approval Summary of Temsirolimus (TORISEL)

[68]	Renal cell carcinoma (Approved on 2007/05/30)
NCT00065468	-
NC10005466	Temsirolimus vs. Ifn-α [OS(M): 10.9 vs. 7.3]

D=day; W=week; M=month

#### Note:

- This table enlists variants detected by the panel other than those with clinical relevance (reported in Testing Result section).

The clinical impact of a genetic variant is determined according to ACT Genomics in-house clinical knowledge database. A negative result does not necessarily indicate absence of biological effect on the tumor. Some variants listed here may possibly have preclinical data or may show potential clinical relevance in the future.

## ACTOnco® + Report

## TEST DETAILS SPECIMEN RECEIVED AND PATHOLOGY REVIEW

- Collection date: Feb 17, 2022

Facility retrieved: 臺北榮總

- H&E-stained section No.: S11175525B

Collection site: Lung

- Examined by: Dr. Yeh-Han Wang

- 1. The percentage of viable tumor cells in total cells in the whole slide (%): 15%
- 2. The percentage of viable tumor cells in total cells in the encircled areas in the whole slide (%): 50%
- 3. The percentage of necrotic cells (including necrotic tumor cells) in total cells in the whole slide (%): 0%
- The percentage of necrotic cells (including necrotic tumor cells) in total cells in the encircled areas in the whole slide (%): 0%
- 5. Additional comment: NA
- Manual macrodissection: Performed on the highlighted region
- The outline highlights the area of malignant neoplasm annotated by a pathologist.

## **RUN QC**

Panel: ACTOnco®+

#### **DNA** test

Mean Depth: 728x

- Target Base Coverage at 100x: 94%

#### **RNA** test

- Average unique RNA Start Sites per control GSP2: 107

行動基因僅提供技術檢測服務及檢測報告,檢測結果之臨床解釋及相關醫療處置,請諮詢專業醫師。報告結果僅對此試驗件有效。 行動基因臨床分子醫學實驗室 台北市內湖區新湖二路345號3F

AG4-QP4001-02(07) page 12 of 21

Project ID: C23-M001-01061 Report No.: AA-23-02011 ONC

Date Reported: Apr 21, 2023

#### LIMITATIONS

- This test does not provide information of variant causality and does not detect variants in non-coding regions that could affect gene expression. This report does not report polymorphisms and we do not classify whether a mutation is germline or somatic. Variants identified by this assay were not subject to validation by Sanger or other technologies.
- The possibility cannot be excluded that certain pathogenic variants detected by other sequencing tools may not be reported in the test because of technical limitation of bioinformatics algorithm or the NGS sequencing platform, e.g. low coverage.
- This test has been designed to detect fusions in 13 genes sequenced. Therefore, fusion in genes not covered by this test would not be reported. For novel fusions detected in this test, Sanger sequencing confirmation is recommended if residue specimen is available

## **NEXT-GENERATION SEQUENCING (NGS) METHODS**

Extracted genomic DNA was amplified using primers targeting coding exons of analyzed genes and subjected to library construction. Barcoded libraries were subsequently conjugated with sequencing beads by emulsion PCR and enriched using Ion Chef system. Sequencing was performed according to Ion Proton or Ion S5 sequencer protocol (Thermo Fisher Scientific).

Raw reads generated by the sequencer were mapped to the hg19 reference genome using the Ion Torrent Suite. Coverage depth was calculated using Torrent Coverage Analysis plug-in. Single nucleotide variants (SNVs) and short insertions/deletions (InDels) were identified using the Torrent Variant Caller plug-in. VEP (Variant Effect Predictor) was used to annotate every variant using databases from Clinvar, COSMIC and Genome Aggregation database. Variants with coverage ≥ 20, allele frequency ≥ 5% and actionable variants with allele frequency ≥ 2% were retained. This test provides uniform coverage of the targeted regions, enabling target base coverage at 100x ≥ 85% with a mean coverage ≥ 500x.

Variants reported in Genome Aggregation database with > 1% minor allele frequency (MAF) were considered as polymorphisms. ACT Genomics in-house database was used to determine technical errors. Clinically actionable and biologically significant variants were determined based on the published medical literature.

The copy number alterations (CNAs) were predicted as described below:

Amplicons with read counts in the lowest 5th percentile of all detectable amplicons and amplicons with a coefficient of variation ≥ 0.3 were removed. The remaining amplicons were normalized to correct the pool design bias. ONCOCNV (an established method for calculating copy number aberrations in amplicon sequencing data by Boeva et al., 2014) was applied for the normalization of total amplicon number, amplicon GC content, amplicon length, and technology-related biases, followed by segmenting the sample with a gene-aware model. The method was used as well for establishing the baseline of copy number variations.

Tumor mutational burden (TMB) was calculated by using the sequenced regions of ACTOnco®+ to estimate the number of somatic nonsynonymous mutations per megabase of all protein-coding genes (whole exome). The TMB calculation predicted somatic variants and applied a machine learning model with a cancer hotspot correction. TMB may be reported as "TMB-High", "TMB-Low" or "Cannot Be Determined". TMB-High corresponds to ≥ 7.5 mutations per megabase (Muts/Mb); TMB-Low corresponds to < 7.5 Muts/Mb. TMB is reported as "Cannot Be Determined" if the tumor purity of the sample is < 30%.

Classification of microsatellite instability (MSI) status is determined by a machine learning prediction algorithm. The change of a number of repeats of different lengths from a pooled microsatellite stable (MSS) baseline in > 400 genomic loci are used as the features for the algorithm. The final output of the results is either microsatellite Stable (MSS) or microsatellite instability high (MSI-H).

#### **RNA** test

Extracted RNA was reverse-transcribed and subjected to library construction. Sequencing was performed according to lon Proton or Ion S5 sequencer protocol (Thermo Fisher Scientific). To ensure sequencing quality for fusion variant analysis, the average unique RNA Start Sites (SS) per control Gene Specific Primer 2 (GSP 2) should be ≥ 10.

## ACTOnco® + Report

The fusion analysis pipeline aligned sequenced reads to the human reference genome, identified regions that map to noncontiguous regions of the genome, applied filters to exclude probable false-positive events and, annotated previously characterized fusion events according to Quiver Gene Fusion Database, a curated database owned and maintained by ArcherDX. In general, samples with detectable fusions need to meet the following criteria: (1) Number of unique start sites (SS) for the GSP2  $\geq$  3; (2) Number of supporting reads spanning the fusion junction  $\geq$  5; (3) Percentage of supporting reads spanning the fusion junction  $\geq$  10%; (4) Fusions annotated in Quiver Gene Fusion Database.

#### **DATABASE USED**

- Reference genome: Human genome sequence hg19
- COSMIC v.92
- Genome Aggregation database r2.1.1
- ClinVar (version 20210404)
- ACT Genomics in-house database
- Quiver Gene Fusion Database version 5.1.18

#### 法律聲明

本檢驗報告僅提供專業醫療參考,結果需經專業醫師解釋及判讀。基因突變資訊非必具備藥物或治療有效性指標,反之亦然。本檢驗報 告提供之用藥指引不聲明或保證其臨床有效性,反之亦然。本基因檢測方法係由本公司研究開發,已經過有效性測試。

本檢驗報告非經本公司許可,不得私自變造、塗改,或以任何方式作為廣告及其他宣傳之用途。

本公司於提供檢驗報告後,即已完成本次契約義務,後續之報告解釋、判讀及用藥、治療,應自行尋求相關專業醫師協助,若需將報告移件其他醫師,本人應取得該醫師同意並填寫移件申請書,主動告知行動基因,行動基因僅能配合該醫師意願與時間提供醫師解說。

### 醫療決策需由醫師決定

任何治療與用藥需經由醫師在考慮病患所有健康狀況相關資訊包含健檢、其他檢測報告和病患意願後,依照該地區醫療照護標準由醫師獨立判斷。醫師不應僅依據單一報告結果(例如本檢測或本報告書內容)做決策。

## 基因突變與用藥資訊並非依照有效性排序

本報告中列出之生物標記變異與藥物資訊並非依照潛在治療有效性排序。

### 證據等級

藥物潛在臨床效益(或缺乏潛在臨床效益)的實證證據是依據至少一篇臨床療效個案報告或臨床前試驗做為評估。本公司盡力提供適時及 準確之資料,但由於醫學科技之發展日新月異,本公司不就本報告提供的資料是否為準確、適宜或最新作保證。

#### 責任

本檢驗報告僅提供專業醫療參考,本公司及其員工不對任何由使用本報告之內容引起的直接、間接、特殊、連帶或衍生的損失或損害承擔責任。

行動基因僅提供技術檢測服務及檢測報告,檢測結果之臨床解釋及相關醫療處置,請諮詢專業醫師。報告結果僅對此試驗件有效。 行動基因臨床分子醫學實驗室 台北市內湖區新湖二路345號3F

- 41. PMID: 3587348; 1987, Nature;327(6120):293-7
  Prevalence of ras gene mutations in human colorectal cancers.
- PMID: 1942608; 1991, Nihon Shokakibyo Gakkai Zasshi;88(8):1539-44
   [Prevalence of K-ras gene mutations in human colorectal cancers].
- 43. PMID: 2252272; 1990, Am Rev Respir Dis;142(6 Pt 2):S27-30 The ras oncogenes in human lung cancer.
- 44. PMID: 1486840; 1992, Environ Health Perspect;98():13-24 Role of proto-oncogene activation in carcinogenesis.
- PMID: 26037647; 2015, Mol Cancer Res;13(9):1325-35
   Biochemical and Structural Analysis of Common Cancer-Associated KRAS Mutations.
- PMID: 20147967; 2010, Br J Cancer;102(4):693-703
   Activating K-Ras mutations outwith 'hotspot' codons in sporadic colorectal tumours implications for personalised cancer medicine.
- 47. PMID: 18349398; 2008, J Clin Oncol;26(9):1472-8
  Molecular characteristics of bronchioloalveolar carcinoma and adenocarcinoma, bronchioloalveolar carcinoma subtype, predict response to erlotinib.
- PMID: 23401440; 2013, J Clin Oncol;31(8):1112-21
   KRAS mutation: should we test for it, and does it matter?
- PMID: 18024870; 2007, J Clin Oncol;25(33):5240-7
   Prognostic and predictive importance of p53 and RAS for adjuvant chemotherapy in non small-cell lung cancer.
- 50. PMID: 29946554; 2018, Gynecol Oncol Rep;25():41-44
  Binimetinib (MEK162) in recurrent low-grade serous ovarian cancer resistant to chemotherapy and hormonal treatment.
- PMID: 26075998; 2014, Gynecol Oncol Rep;10():28-9
   Response to MEK inhibitor in small cell neuroendocrine carcinoma of the cervix with a KRAS mutation.
- 52. PMID: 25722381; 2015, Ann Oncol;26(5):894-901
  A randomized phase II study of the MEK1/MEK2 inhibitor trametinib (GSK1120212) compared with docetaxel in KRAS-mutant advanced non-small-cell lung cancer (NSCLC)†.
- 53. PMID: 24947927; 2014, Clin Cancer Res;20(16):4251-61
  Phase I expansion and pharmacodynamic study of the oral MEK inhibitor RO4987655 (CH4987655) in selected patients with advanced cancer with RAS-RAF mutations.
- PMID: 27340376; 2016, Curr Colorectal Cancer Rep;12():141-150
   Molecular Subtypes and Personalized Therapy in Metastatic Colorectal Cancer.
- 55. PMID: 22392911; 2012, Clin Cancer Res;18(9):2515-25
  Inhibition of MEK and PI3K/mTOR suppresses tumor growth but does not cause tumor regression in patient-derived xenografts of RAS-mutant colorectal carcinomas.
- PMID: 26369631; 2016, Clin Cancer Res;22(2):405-14
   Sensitivity of KRAS-Mutant Colorectal Cancers to Combination Therapy That Cotargets MEK and CDK4/6.
- 57. PMID: 24407191; 2014, Br J Cancer;110(5):1148-54

Project ID: C23-M001-01061 Report No.: AA-23-02011\_ONC Date Reported: Apr 21, 2023

## ACTOnco® + Report

Sorafenib and irinotecan (NEXIRI) as second- or later-line treatment for patients with metastatic colorectal cancer and KRAS-mutated tumours: a multicentre Phase I/II trial.

- 58. PMID: 23224737; 2013, Clin Cancer Res;19(3):743-51
  A phase II study of sorafenib in patients with platinum-pretreated, advanced (Stage IIIb or IV) non-small cell lung cancer with a KRAS mutation.
- PMID: 26307133; 2016, Clin Cancer Res;22(2):374-82
   Copy Number Changes Are Associated with Response to Treatment with Carboplatin, Paclitaxel, and Sorafenib in Melanoma.
- PMID: 15923428; 2005, Ann Oncol;16 Suppl 4():iv44-49
   Prognostic and predictive factors in colorectal cancer: Kirsten Ras in CRC (RASCAL) and TP53CRC collaborative studies.
- 61. PMID: 26484411; 2015, Br J Cancer;113(9):1254-8 Impact of mutational status on survival in low-grade serous carcinoma of the ovary or peritoneum.
- 62. PMID: 24549645; 2013, J Pathol;231(4):449-56
  KRAS (but not BRAF) mutations in ovarian serous borderline tumour are associated with recurrent low-grade serous carcinoma.
- 63. PMID: 26703889; 2016, Lancet;387(10022):968-977
  Everolimus for the treatment of advanced, non-functional neuroendocrine tumours of the lung or gastrointestinal tract (RADIANT-4): a randomised, placebo-controlled, phase 3 study.
- 64. PMID: 22149876; 2012, N Engl J Med;366(6):520-9
  Everolimus in postmenopausal hormone-receptor-positive advanced breast cancer.
- 65. PMID: 21306238; 2011, N Engl J Med;364(6):514-23
  Everolimus for advanced pancreatic neuroendocrine tumors.
- 66. PMID: 23158522; 2013, Lancet;381(9861):125-32
  Efficacy and safety of everolimus for subependymal giant cell astrocytomas associated with tuberous sclerosis complex (EXIST-1): a multicentre, randomised, placebo-controlled phase 3 trial.
- 67. PMID: 18653228; 2008, Lancet; 372(9637):449-56
  Efficacy of everolimus in advanced renal cell carcinoma: a double-blind, randomised, placebo-controlled phase III trial.
- PMID: 17538086; 2007, N Engl J Med;356(22):2271-81
   Temsirolimus, interferon alfa, or both for advanced renal-cell carcinoma.
