# ACTOnco® + Report

PATIENT			
Name: 陳文琦	Patient ID: 45699001		
Date of Birth: Oct 28, 1976	Gender: Female		
Diagnosis: Hepatocellular carcinoma			
ORDERING PHYSICIAN			
Name: 陳三奇醫師	Tel: 886-228712121		
Facility: 臺北榮總			
Address: 臺北市北投區石牌路二段 201 號			
SPECIMEN			
Specimen ID: S11078234B Collection site: Lung	Type: FFPE tissue		
Date received: Aug 04, 2022 Lab ID: AA-22-04529	D/ID: NA		

#### ABOUT ACTOnco®

The test is a next-generation sequencing (NGS)-based assay developed for efficient and comprehensive genomic profiling of cancers. This test interrogates coding regions of 440 genes associated with cancer treatment, prognosis and diagnosis. Genetic mutations detected by this test include small-scale mutations like single nucleotide variants (SNVs), small insertions and deletions (InDels) (≤ 15 nucleotides) and large-scale genomic alterations like copy number alterations (CNAs). The test also includes an RNA test, detecting fusion transcripts of 13 genes.

# SUMMARY FOR ACTIONABLE VARIANTS VARIANTS/BIOMARKERS WITH EVIDENCE OF CLINICAL SIGNIFICANCE

Genomic	Probable Effects in F	Probable Sensitive in Other							
Alterations/Biomarkers	Sensitive	Sensitive Resistant							
Not detected									

### VARIANTS/BIOMARKERS WITH POTENTIAL CLINICAL SIGNIFICANCE

Genomic Alterations/Biomarkers	Possibly Sensitive	Possibly Resistant
	Not detected	

### Note:

- The above summary tables present genomic variants and biomarkers based on the three-tiered approach proposed by US FDA for reporting tumor profiling NGS testing. "Variants/biomarkers with evidence of clinical significance" refers to mutations that are widely recognized as standard-of-care biomarkers (FDA level 2/AMP tier 1). "Variants/biomarkers with potential clinical significance" refers to mutations that are not included in the standard of care but are informational for clinicians, which are commonly biomarkers used as inclusion criterial for clinical trials (FDA level 3/AMP tier 2).
- The therapeutic agents and possible effects to a given drug are based on mapping the variants/biomarkers with ACT Genomics clinical knowledge database. The mapping results only provide information for reference, but not medical recommendation.
- Please refer to corresponding sections for more detailed information about genomic alteration and clinical relevance listed above.

## - Single Nucleotide and Small InDel Variants

Gene	Amino Acid Change	Allele Frequency
	Not detected	

# - Copy Number Alterations

Chromosome	Gene	Variation	Copy Number
Chr20	AURKA, GNAS, ZNF217	Amplification	6 <sup>¥</sup>

<sup>\*</sup> Increased gene copy number was observed.

### - Fusions

Fusion Gene & Exon	Transcript ID
No fus	on gene detected in this sample

# - Immune Checkpoint Inhibitor (ICI) Related Biomarkers

Biomarker	Results				
Tumor Mutational Burden (TMB)	< 1 muts/Mb				
Microsatellite Instability (MSI)	Microsatellite stable (MSS)				

### Note:

- Loss of heterozygosity (LOH) information was used to infer tumor cellularity. Copy number alteration in the tumor was determined based on 50% tumor purity.
- TMB was calculated by using the sequenced regions of ACTOnco®+ to estimate the number of somatic nonsynonymous mutations per megabase of all protein-coding genes (whole exome). The threshold for high mutation load is set at ≥ 7.5 mutations per megabase. TMB, microsatellite status and gene copy number deletion cannot be determined if calculated tumor purity is < 30%.

ACTOnco® + Report

# **IMMUNE CHECKPOINT INHIBITORS (ICIs)**

No genomic alterations detected to confer sensitivity or lack of benefit to immune checkpoint therapies.

### - Other Biomarkers with Potential Clinical Effects for ICIs

Genomic Alterations	Potential Clinical Effects
	Not detected

Note: Tumor non-genomic factors, such as patient germline genetics, PDL1 expression, tumor microenvironment, epigenetic alterations or other factors not provided by this test may affect ICI response.

### **CHEMOTHERAPIES**

No genomic alterations detected in this tumor predicted to confer sensitivity or lack of benefit to chemotherapies.

### **HORMONAL THERAPIES**

No genomic alterations detected in this tumor predicted to confer sensitivity or lack of benefit to hormonal therapies.

### **OTHERS**

No genomic alterations detected in this tumor predicted to confer sensitivity or lack of benefit to other therapies.

### Note:

Therapeutic implications provided in the test are based solely on the panel of 440 genes sequenced. Therefore, alterations in genes not covered in this panel, epigenetic and post-transcriptional and post-translational factors may also determine a patient's response to therapies. In addition, several other patient-associated clinical factors, including but not limited to, prior lines of therapies received, dosage and combinations with other therapeutic agents, patient's cancer types, sub-types, and/or stages, may also determine the patient's clinical response to therapies.

## VARIANT INTERPRETATION

# **AURKA Amplification**

### **Biological Impact**

The Aurora kinase A (AURKA) gene encodes a serine/threonine kinase involved in the regulation of cell cycle and maintenance of genomic integrity<sup>[1]</sup>. AURKA gene amplification is commonly observed in a wide range of human cancers, including breast cancer<sup>[2]</sup>, ovarian cancer<sup>[3]</sup>, gastric cancer<sup>[4]</sup>, colorectal<sup>[5]</sup>, esophageal cancer<sup>[6]</sup>, bladder cancer<sup>[7]</sup>and leukemia<sup>[8]</sup>.

### Therapeutic and prognostic relevance

Small-molecule inhibitors targeting AURKA (and the related Aurora B and C kinases) are currently studied in clinical trials. A Phase II study of the investigational aurora kinase A inhibitor, alisertib, demonstrated activity and safety in patients with breast and small-cell lung cancer (SCLC)<sup>[9]</sup>.

Elevated AURKA activity was associated with taxane resistance in breast cancer patients<sup>[10]</sup>, and platinum resistance in high-grade serous ovarian carcinoma patients<sup>[11]</sup>.

Estrogen receptor positive breast cancer patients with increased AURKA expression were resistant to tamoxifen treatment and had a poorer prognosis<sup>[12][13]</sup>.

## **GNAS Amplification**

### **Biological Impact**

GNAS encodes the alpha subunit of the stimulator G protein (Gs-alpha), a guanine-nucleotide binding protein (G protein) involved in the hormonal regulation of adenylate cyclase<sup>[14]</sup>. The common mutations of GNAS have been identified in tumors, including R201C, R201H, and Q227R, resulting in constitutive activation of Gs-alpha and its effector adenylate cyclase, leading to increased cAMP accumulation, and constitutive cAMP signaling, associated with excessive proliferation and tumor development<sup>[15][16][14]</sup>. GNAS activation may affect downstream MAPK and Wnt signaling pathway, suggesting activating mutation of GNAS can modify cell growth and may be oncogenic<sup>[16]</sup>.

Amplification of GNAS is commonly observed in ER-positive breast cancers<sup>[17]</sup>, which is associated with increased MAPK/ERK signaling and tumor pathogenesis<sup>[17]</sup>.

### Therapeutic and prognostic relevance

Low expression of GNAS has been reported to associate with both poor overall survival and PSA progression-free survival in prostate cancer<sup>[18]</sup>.

GNAS amplification was significantly associated with poor progression-free survival (PFS) in advanced epithelial ovarian cancer patients receiving standard therapy and poor survival in intrahepatic cholangiocarcinoma<sup>[19][20]</sup>.

### **ZNF217** Amplification

### **Biological Impact**

The zinc-finger protein 217 (ZNF217) is a member of Kruppel-like family (KLF) of transcription factors<sup>[21][22]</sup>. ZNF217 is an oncogenic protein that plays deleterious functions in various human cancers<sup>[23]</sup>by inducing epithelial-mesenchymal transition (EMT)<sup>[24]</sup>, activating the ERBB2/ERBB4/FAK<sup>[24]</sup>and AKT<sup>[25]</sup>pathways. The increased copy number of ZNF217 has been reported in breast cancer<sup>[26]</sup>. In colorectal cancer and ovarian cancer, amplification of the ZNF217 gene is associated with increased protein or mRNA expression<sup>[27][28]</sup>. Overexpression of ZNF217 has been found in solid tumors<sup>[29][30][31][32]</sup>.

# ACTOnco® + Report

## Therapeutic and prognostic relevance

A high expression level of ZNF217 has been shown to confer tamoxifen resistance in ER+ breast cancer cells and is a predictor of relapse under endocrine therapy in patients with ER+ breast cancer<sup>[33]</sup>. Overexpression of ZNF217 is also linked to poor outcome in ovarian and colon cancer<sup>[31][32]</sup>.

ZNF217-overexpressing breast cancer cells were correlated with paclitaxel resistance in vitro<sup>[25][34]</sup>. In a retrospective study, tumors that responded to doxorubicin or a combination of 5-fluorouracil and mitomycin (FUMI) expressed less ZNF217 than did nonresponsive tumors<sup>[35]</sup>. Triciribine, a nucleoside analogue and DNA synthesis inhibitor, inhibits tumor growth of ZNF217-overexpressing tumor in vivo. However, results from a Phase II study showed that antitumor activity of triciribine was not evident in all patients, possibly due to a lack of biomarkers for patient selections<sup>[35]</sup>. Expression of ZNF217 may serve as a potential biomarker for the treatment of triciribine<sup>[35]</sup>.

High level of ZNF217 expression represents a biomarker for poor prognosis associated with shorter relapse-free survival in breast cancer and ovarian cancer<sup>[24][28]</sup>.

### Note:

- This table enlists variants detected by the panel other than those with clinical relevance (reported in Testing Result section).

The clinical impact of a genetic variant is determined according to ACT Genomics in-house clinical knowledge database. A negative result does not necessarily indicate absence of biological effect on the tumor. Some variants listed here may possibly have preclinical data or may show potential clinical relevance in the future.

- H&E-stained section No.: S11078234B
- Collection site: Lung
- Examined by: Dr. Chien-Ta Chiang
  - 1. The percentage of viable tumor cells in total cells in the whole slide (%): 10%
  - 2. The percentage of viable tumor cells in total cells in the encircled areas in the whole slide (%): 70%
  - 3. The percentage of necrotic cells (including necrotic tumor cells) in total cells in the whole slide (%): 0%
  - 4. The percentage of necrotic cells (including necrotic tumor cells) in total cells in the encircled areas in the whole slide (%): 0%
  - 5. Additional comment: NA
- Manual macrodissection: Performed on the highlighted region
- The outline highlights the area of malignant neoplasm annotated by a pathologist.

### **RUN QC**

- Panel: ACTOnco®+

### **DNA** test

- Mean Depth: 881x
- Target Base Coverage at 100x: 93%

### RNA test

Average unique RNA Start Sites per control GSP2: 80

### **LIMITATIONS**

 This test does not provide information of variant causality and does not detect variants in non-coding regions that could affect gene expression. This report does not report polymorphisms and we do not classify whether a mutation is germline or somatic.
 Variants identified by this assay were not subject to validation by Sanger or other technologies.

行動基因僅提供技術檢測服務及檢測報告,檢測結果之臨床解釋及相關醫療處置,請諮詢專業醫師。報告結果僅對此試驗件有效。 行動基因臨床分子醫學實驗室 台北市內湖區新湖二路345號3F

Date Reported: Aug 17, 2022

# ACTOnco® + Report

- The possibility cannot be excluded that certain pathogenic variants detected by other sequencing tools may not be reported in the test because of technical limitation of bioinformatics algorithm or the NGS sequencing platform, e.g. low coverage.
- This test has been designed to detect fusions in 13 genes sequenced. Therefore, fusion in genes not covered by this test would 3. not be reported. For novel fusions detected in this test, Sanger sequencing confirmation is recommended if residue specimen is available.

# **NEXT-GENERATION SEQUENCING (NGS) METHODS**

### **DNA** test

Extracted genomic DNA was amplified using primers targeting coding exons of analyzed genes and subjected to library construction. Barcoded libraries were subsequently conjugated with sequencing beads by emulsion PCR and enriched using Ion Chef system. Sequencing was performed according to Ion Proton or Ion S5 sequencer protocol (Thermo Fisher Scientific).

Raw reads generated by the sequencer were mapped to the hg19 reference genome using the Ion Torrent Suite. Coverage depth was calculated using Torrent Coverage Analysis plug-in. Single nucleotide variants (SNVs) and short insertions/deletions (InDels) were identified using the Torrent Variant Caller plug-in. VEP (Variant Effect Predictor) was used to annotate every variant using databases from Clinvar, COSMIC and Genome Aggregation database. Variants with coverage  $\geq$  20, allele frequency  $\geq$  5% and actionable variants with allele frequency ≥ 2% were retained. This test provides uniform coverage of the targeted regions, enabling target base coverage at  $100x \ge 85\%$  with a mean coverage  $\ge 500x$ .

Variants reported in Genome Aggregation database with > 1% minor allele frequency (MAF) were considered as polymorphisms. ACT Genomics in-house database was used to determine technical errors. Clinically actionable and biologically significant variants were determined based on the published medical literature.

The copy number alterations (CNAs) were predicted as described below:

Amplicons with read counts in the lowest 5th percentile of all detectable amplicons and amplicons with a coefficient of variation ≥ 0.3 were removed. The remaining amplicons were normalized to correct the pool design bias. ONCOCNV (an established method for calculating copy number aberrations in amplicon sequencing data by Boeva et al., 2014) was applied for the normalization of total amplicon number, amplicon GC content, amplicon length, and technology-related biases, followed by segmenting the sample with a gene-aware model. The method was used as well for establishing the baseline of copy number variations.

Tumor mutational burden (TMB) was calculated by using the sequenced regions of ACTOnco®+ to estimate the number of somatic nonsynonymous mutations per megabase of all protein-coding genes (whole exome). The TMB calculation predicted somatic variants and applied a machine learning model with a cancer hotspot correction. TMB may be reported as "TMB-High", "TMB-Low" or "Cannot Be Determined". TMB-High corresponds to ≥ 7.5 mutations per megabase (Muts/Mb); TMB-Low corresponds to < 7.5 Muts/Mb. TMB is reported as "Cannot Be Determined" if the tumor purity of the sample is < 30%.

Classification of microsatellite instability (MSI) status is determined by a machine learning prediction algorithm. The change of a number of repeats of different lengths from a pooled microsatellite stable (MSS) baseline in > 400 genomic loci are used as the features for the algorithm. The final output of the results is either microsatellite Stable (MSS) or microsatellite instability high (MSI-H).

### RNA test

Extracted RNA was reverse-transcribed and subjected to library construction. Sequencing was performed according to Ion Proton or Ion S5 sequencer protocol (Thermo Fisher Scientific). To ensure sequencing quality for fusion variant analysis, the average unique RNA Start Sites (SS) per control Gene Specific Primer 2 (GSP 2) should be ≥ 10.

The fusion analysis pipeline aligned sequenced reads to the human reference genome, identified regions that map to noncontiguous regions of the genome, applied filters to exclude probable false-positive events and, annotated previously characterized fusion events according to Quiver Gene Fusion Database, a curated database owned and maintained by ArcherDX. In general, samples with detectable fusions need to meet the following criteria: (1) Number of unique start sites (SS) for the GSP2 ≥ 3; (2) Number of supporting

### 法律聲明

本檢驗報告僅提供專業醫療參考,結果需經專業醫師解釋及判讀。基因突變資訊非必具備藥物或治療有效性指標,反之亦然。本檢驗報告提供之用藥指引不聲明或保證其臨床有效性,反之亦然。本基因檢測方法係由本公司研究開發,已經過有效性測試。

本檢驗報告非經本公司許可,不得私自變造、塗改,或以任何方式作為廣告及其他宣傳之用途。

本公司於提供檢驗報告後,即已完成本次契約義務,後續之報告解釋、判讀及用藥、治療,應自行尋求相關專業醫師協助,若需將報告移件其他醫師,本人應取得該醫師同意並填寫移件申請書,主動告知行動基因,行動基因僅能配合該醫師意願與時間提供醫師解說。

### 醫療決策需由醫師決定

任何治療與用藥需經由醫師在考慮病患所有健康狀況相關資訊包含健檢、其他檢測報告和病患意願後,依照該地區醫療照護標準由醫師獨立判斷。醫師不應僅依據單一報告結果(例如本檢測或本報告書內容)做決策。

# 基因突變與用藥資訊並非依照有效性排序

本報告中列出之生物標記變異與藥物資訊並非依照潛在治療有效性排序。

### 證據等級

藥物潛在臨床效益(或缺乏潛在臨床效益)的實證證據是依據至少一篇臨床療效個案報告或臨床前試驗做為評估。本公司盡力提供適時及 準確之資料,但由於醫學科技之發展日新月異,本公司不就本報告提供的資料是否為準確、適宜或最新作保證。

### 責任

本檢驗報告僅提供專業醫療參考,本公司及其員工不對任何由使用本報告之內容引起的直接、間接、特殊、連帶或衍生的損失或損害承擔責任。

行動基因僅提供技術檢測服務及檢測報告,檢測結果之臨床解釋及相關醫療處置,請諮詢專業醫師。報告結果僅對此試驗件有效。 行動基因臨床分子醫學實驗室 台北市內湖區新湖二路345號3F
