ACTOnco® + Report

PATIENT	
Name: 黃渟涵	Patient ID: 46791633
Date of Birth: Apr 05, 2000	Gender: Female
Diagnosis: Hepatocellular carcinoma	
ORDERING PHYSICIAN	
Name: 陳三奇醫師	Tel: 886-228712121
Facility: 臺北榮總	
Address: 臺北市北投區石牌路二段 201 號	
SPECIMEN	
Specimen ID: S0908269D Collection site: Liver	Type: FFPE tissue
Date received: Sep 06, 2022 Lab ID: AA-22-05182	D/ID: NA

ABOUT ACTORCO®+

The test is a next-generation sequencing (NGS)-based assay developed for efficient and comprehensive genomic profiling of cancers. This test interrogates coding regions of 440 genes associated with cancer treatment, prognosis and diagnosis. Genetic mutations detected by this test include small-scale mutations like single nucleotide variants (SNVs), small insertions and deletions (InDels) (≤ 15 nucleotides) and large-scale genomic alterations like copy number alterations (CNAs). The test also includes an RNA test, detecting fusion transcripts of 13 genes.

SUMMARY FOR ACTIONABLE VARIANTS VARIANTS/BIOMARKERS WITH EVIDENCE OF CLINICAL SIGNIFICANCE

Genomic	Probable Effects in F	atient's Cancer Type	Probable Sensitive in Other
Alterations/Biomarkers	Sensitive	Resistant	Cancer Types
	Not de	tected	

VARIANTS/BIOMARKERS WITH POTENTIAL CLINICAL SIGNIFICANCE

Genomic Alterations/Biomarkers	Possibly Sensitive	Possibly Resistant
ERBB3 R1127H	Lapatinib	-
MCL1 Amplification	Regorafenib, Sorafenib	-

Note:

- The above summary tables present genomic variants and biomarkers based on the three-tiered approach proposed by US FDA for reporting tumor profiling NGS testing. "Variants/biomarkers with evidence of clinical significance" refers to mutations that are widely recognized as standard-of-care biomarkers (FDA level 2/AMP tier 1). "Variants/biomarkers with potential clinical significance" refers to mutations that are not included in the standard of care but are informational for clinicians, which are commonly biomarkers used as inclusion criterial for clinical trials (FDA level 3/AMP tier 2).
- The therapeutic agents and possible effects to a given drug are based on mapping the variants/biomarkers with ACT Genomics clinical knowledge database. The mapping results only provide information for reference, but not medical recommendation.
- Please refer to corresponding sections for more detailed information about genomic alteration and clinical relevance listed above.

ACTOnco® + Report

TESTING RESULTS

VARIANT(S) WITH CLINICAL RELEVANCE

- Single Nucleotide and Small InDel Variants

Gene	Amino Acid Change	Allele Frequency
AXIN1	V683fs	50.8%
ERBB3	R1127H	63.8%

- Copy Number Alterations

Chromosome	Gene	Variation	Copy Number
Chr16	AXIN1, PALB2, TSC2	Heterozygous deletion	1
Chr4	FBXW7	Heterozygous deletion	1
Chr1	MCL1, NTRK1	Amplification	6

- Fusions

Fusion Gene & Exon	Transcript ID
	No fusion gene detected in this sample

- Immune Checkpoint Inhibitor (ICI) Related Biomarkers

Biomarker	Results
Tumor Mutational Burden (TMB)	< 1 muts/Mb
Microsatellite Instability (MSI)	Microsatellite stable (MSS)

Note:

- Variant(s) enlisted in the SNV table may currently exhibit no relevance to treatment response prediction. Please refer to INTERPRETATION for more biological information and/or potential clinical impacts of the variants.
- Loss of heterozygosity (LOH) information was used to infer tumor cellularity. Copy number alteration in the tumor was determined based on 57% tumor purity.
- For more therapeutic agents which are possibly respond to heterozygous deletion of genes listed above, please refer to APPENDIX for more information.
- TMB was calculated by using the sequenced regions of ACTOnco®+ to estimate the number of somatic nonsynonymous mutations per megabase of all protein-coding genes (whole exome). The threshold for high mutation load is set at ≥ 7.5 mutations per megabase. TMB, microsatellite status and gene copy number deletion cannot be determined if calculated tumor purity is < 30%.

THERAPEUTIC IMPLICATIONS

TARGETED THERAPIES

Genomic Alterations	Therapies	Effect
Level 4		
ERBB3 R1127H	Lapatinib	sensitive
MCL1 Amplification	Regorafenib, Sorafenib	sensitive

Therapies associated with benefit or lack of benefit are based on biomarkers detected in this tumor and published evidence in professional guidelines or peer-reviewed journals.

Level	Description
1	FDA-recognized biomarkers predictive of response or resistance to FDA approved drugs in this indication
2	Standard care biomarkers (recommended by the NCCN guideline) predictive of response or resistance to FDA approved drugs in this indication
зА	Biomarkers predictive of response or resistance to therapies approved by the FDA or NCCN guideline in a different cancer type
3B	Biomarkers that serve as inclusion criteria for clinical trials (minimal supportive data required)
4	Biomarkers that show plausible therapeutic significance based on small studies, few case reports, or preclinical studies

AG4-QP4001-02(06)

ACTOnco® + Report

IMMUNE CHECKPOINT INHIBITORS (ICIs)

No genomic alterations detected to confer sensitivity or lack of benefit to immune checkpoint therapies.

- Other Biomarkers with Potential Clinical Effects for ICIs

Genomic Alterations	Potential Clinical Effects
	Not detected

Note: Tumor non-genomic factors, such as patient germline genetics, PDL1 expression, tumor microenvironment, epigenetic alterations or other factors not provided by this test may affect ICI response.

CHEMOTHERAPIES

No genomic alterations detected in this tumor predicted to confer sensitivity or lack of benefit to chemotherapies.

HORMONAL THERAPIES

No genomic alterations detected in this tumor predicted to confer sensitivity or lack of benefit to hormonal therapies.

OTHERS

No genomic alterations detected in this tumor predicted to confer sensitivity or lack of benefit to other therapies.

Note:

Therapeutic implications provided in the test are based solely on the panel of 440 genes sequenced. Therefore, alterations in genes not covered in this panel, epigenetic and post-transcriptional and post-translational factors may also determine a patient's response to therapies. In addition, several other patient-associated clinical factors, including but not limited to, prior lines of therapies received, dosage and combinations with other therapeutic agents, patient's cancer types, sub-types, and/or stages, may also determine the patient's clinical response to therapies.

VARIANT INTERPRETATION

AXIN1 V683fs, Heterozygous deletion

Biological Impact

AXIN1 gene encodes a scaffold protein that is a component of the beta-catenin destruction complex. In the complex, AXIN1 provide scaffolding for the APC, GSK-3 beta and beta-catenin, which enables the degradation of beta-catenin in the absence of WNT ligand binding and negatively regulates WNT signaling pathway^{[1][2]}. Somatic mutations and deletions of AXIN1 have been reported in hepatocellular carcinoma^[3], medulloblastoma^{[4][5]}, gastrointestinal cancer^[6], and colorectal cancer^[7].

V683fs mutation results in a change in the amino acid sequence beginning at 683, likely to cause premature truncation of the functional AXIN1 protein (UniProtKB). This mutation is predicted to lead to a loss of AXIN1 protein function, despite not being characterized in the literature. Loss of the second wild-type allele resulted in the biallelic inactivation of the gene.

Therapeutic and prognostic relevance

A retrospective study (n = 124) has demonstrated that reduced AXIN expression in tumor specimen was associated with poor survival in patients with esophageal squamous cell carcinoma (ESCC)^[8].

ERBB3 R1127H

Biological Impact

The ERBB3 (also known as HER3) gene encodes a member of the epidermal growth factor receptor (EGFR) family of receptor tyrosine kinases^[9]. HER3 lacks or has little intrinsic tyrosine kinase activity. Upon binding of its ligand, neu differentiation factor (NDF), HER3 forms a heterodimer with ErbB2^[10]and subsequently activates various mitogenic signaling cascades, including the PI3K/AKT/mTOR, STAT and RAS/RAF/MAPK^{[11][12][13]}. Aberrant expression or alterations of the ErbB family play crucial roles in the development and progression of cancer^[14]. Enhanced expression of HER2 has been observed in a broad spectrum of human cancers, including gastric, bladder, uterine, colorectal, and breast cancers^[15]. HER3 is the preferred heterodimeric partner for EGFR in melanoma and pancreatic carcinoma^{[16][17]}, while in breast cancer, HER3 preferably heterodimerizes with HER2 and plays a critical role in HER2-mediated tumorigenesis.

ERBB3 R1127H locates within the cytoplasmic domain of the HER3 protein (UniProtKB). However, this variant has not been characterized; therefore, its biological impact on the ERBB3 protein remains unknown.

Therapeutic and prognostic relevance

Currently, there are no FDA-approved anti-HER3 therapies for patients with solid tumors. A variety of strategies targeting HER3 including pan HER approach, abrogating its dimerization partners' kinase activity using small molecule inhibitors (e.g. lapatinib, erlotinib, gefitinib, afatinib, and neratinib) or direct targeting of its extracellular domain (e.g. including AV-203 (Abstract nr 2509, AACR 2012)) are under investigation [18][19].

Preclinical data indicated that HER3 expression level is a predictive biomarker of pertuzumab (an anti-HER2 antibody) efficacy in HER2 low-expressing pancreatic cancer^[20].

ERBB3 mutation has been selected as an inclusion criteria for the trial examining afatinib in urothelial tract carcinoma, non-small cell lung carcinoma (NSCLC) and malignant solid tumor (NCT02780687, NCT01523587, NCT03810872)[21][22].

One patient with intrahepatic cholangiocarcinoma carrying an ERBB3 R1127H mutation responded to lapatinib, an ERBB inhibitor treatment, had 20.5 and 24.8 months of PFS, and OS, respectively^[23].

ACTOnco® + Report

FBXW7 Heterozygous deletion

Biological Impact

The F-box/WD repeat-containing protein 7 (FBXW7) gene encodes a protein that belongs to the SCF (SKP1-CUL1-F-box protein) E3 ligase complex. FBXW7 is recognized as a tumor suppressor which is involved in the negative regulation of oncogenes such as c-Myc^{[24][25]}, c-Jun^[26], cyclin E^[27], Notch family members^{[28][29]}, Aurora-A^[30], mTOR^[31], KLF5^[32], and MCL-1^[33]. Inactivating FBXW7 mutation or copy number loss may result in the accumulation of oncoproteins and therefore lead to malignant transformation^[34]. FBXW7 is a haploinsufficient tumor suppressor gene with one copy loss may lead to weak protein expression and is insufficient to execute its original physiological functions^{[32][33][35]}.

Therapeutic and prognostic relevance

Clinical efficacy of mTOR inhibitors was seen in patients harboring aberrations in the FBXW7 gene (one patient with refractory fibrolamellar hepatocellular carcinoma, and one patient with lung adenocarcinoma)^{[36][37]}. Moreover, in vitro assay also suggested that loss or inactivation of FBXW7 may confer sensitivity to mTOR inhibitor^[31].

Preclinical studies suggested that mutations or loss of FBXW7 were associated with regorafenib and oxaliplatin resistance in CRC cell lines and gefitinib resistance in lung cancer cells^{[38][39][40][41]}.

Retrospective studies have indicated that a relatively low expression level of FBXW7 is an independent prognostic marker of poor survival for patients with hepatocellular carcinoma, lung adenocarcinoma and squamous cell carcinoma^{[42][40]}.

MCL1 Amplification

Biological Impact

The myeloid cell leukemia 1 (MCL1) gene encodes a member of the BCL2 pro-survival family^[43]. MCL1 is highly regulated by various oncogenic signaling pathways, including the mitogen-activated protein kinase (MAPK) pathway^[44], the mTOR pathway^[45], and the phosphatidylinositol-3 kinase (PI3K) pathway^[46]. Oncogenic roles for MCL1 have been previously suggested by the report of increased rates of lymphoma in transgenic mice^[47]. Somatic amplification of MCL1 may be a common mechanism in cancer cells to increase cell survival^[48]. MCL1 overexpression was observed from a retrospective analysis of parotid gland carcinomas, including adenoid cystic carcinoma^[49].

Therapeutic and prognostic relevance

Therapies targeting MCL1 and other BCL2 family members with the pan-BCL2 family inhibitors are currently under investigation^[50]. A case report has demonstrated clinical efficacy of sorafenib, when combined with vorinostat, in a metastatic triple-negative breast cancer (TNBC) patient with MCL1-amplified tumor^[51]. Several in vitro studies also showed that sorafenib induces cell death via inhibition of MCL1 expression in multiple cancer types including, hepatocellular carcinoma (HCC), lung cancer, breast cancer, cholangiocarcinoma, endometrial cancer and chronic lymphocytic leukemia^{[52][53][54][55][56][57]}. Preclinical studies have also demonstrated the efficacy of regorafenib in reducing MCL1 expression in human colorectal cancer (CRC) cell lines^{[58][59]}. In vivo models of colon cancer showed that MCL1 expression is inhibited by targeting of the mTOR pathway using everolimus, promoting increased tumor cell killing of cancers with KRAS or BRAF mutations^[60].

AG4-QP4001-02(06) page **6** of **29**

NTRK1 Amplification

Biological Impact

The NTRK1 gene encodes the TRKA (tropomyosin receptor kinase) receptor which plays an important role in the development and function of the nervous system. Gene fusions of NTRK1 lead to constitutive activation of MAP-kinase, PI3-kinase, and PLC-y pathways, and represent the main molecular alterations with known oncogenic and transforming potential in various malignancies, including soft tissue sarcoma, non-small cell lung cancer (NSCLC), glioblastoma multiforme (GBM), thyroid carcinoma, and pilocytic astrocytomas[61][62]. A pan-cancer study (n=1250) demonstrated that 2.2% of the metastatic cancer patients harbored NTRK amplification and NTRK protein overexpression was observed in 14.8% of NTRK-amplified tumors (doi.org/10.23838/pfm.2017.00142).

Therapeutic and prognostic relevance

Patients with NTRK1 amplification had only limited benefit from larotrectinib treatment according to the few clinical studies. One of them had a partial response with larotrectinib of short duration (3.7 months)[63], and the other one with metastatic NTRK1-amplified (copy number=8) esophageal carcinoma showed clinical efficacy for six weeks, and then a progressive disease of new lesions were observed^[64].

PALB2 Heterozygous deletion

Biological Impact

The partner and localizer of BRCA2 (PALB2) gene encodes a protein that plays a critical role in homologous recombination repair (HRR) through its ability to interact with BRCA2 in nuclear foci, promoting its localization and stability in key nuclear structures[65]. The Fanconi anemia complementation group (FANC) which includes FANCA, FANCB, FANCC, FANCD1 (also called BRCA2), FANCD2, FANCE, FANCF, FANCG, FANCI, FANCJ (also called BRIP1), FANCL, FANCM and FANCN (also called PALB2) are involved in the repair of DNA double-strand breaks (DSBs) by homologous recombination (HR)[66][67][68]. PALB2 is a haploinsufficient tumor suppressor gene with one copy loss may lead to weak protein expression and is insufficient to execute its original physiological function[69]. Biallelic germline loss-of-function mutations in PALB2 cause Fanconi anemia, whereas monoallelic loss-of-function mutations are associated with an increased risk of breast cancer and pancreatic cancer^[70]. Fanconi Anemia is an autosomal recessive disease characterized by hematological abnormalities, bone marrow failure, limb deformities, skin hyperpigmentation, and susceptibility to hematologic and solid malignancies, such as acute myeloid leukemia and head and neck carcinoma^{[71][72]}.

Therapeutic and prognostic relevance

In May 2020, the U.S. FDA approved olaparib for the treatment of adult patients with metastatic castration-resistant prostate cancer (mCRPC) who carry mutations in homologous recombination repair (HRR) genes, including BRCA1, BRCA2, ATM, BARD1, BRIP1, CDK12, CHEK1, CHEK2, FANCL, PALB2, RAD51B, RAD51C, RAD51D, RAD54L, and progressed following prior treatment with enzalutamide or abiraterone acetate^[73].

NCCN guideline for pancreatic cancer recommended that rucaparib as maintenance therapy following prior platinumbased therapy for patients with pancreatic adenocarcinoma harboring PALB2 mutations[74].

In a Phase I trial, a pancreatic cancer patient harboring a PALB2 mutation had a partial response to talazoparib treatment[75]. In a preclinical study, talazoparib demonstrated anti-tumor activity on a Wilms tumor cell line with a PALB2 truncating mutation in mice xenograft model[76]. PALB2 loss of function mutation has been determined as an inclusion criterion for the trial evaluating rucaparib efficacy in ovarian cancer[77] or prostate cancer[78]; talazoparib efficacy in HER2-negative breast cancer (NCT02401347), prostate cancer (NCT03148795) or lung cancer (NCT03377556); niraparib efficacy in pancreatic cancer (NCT03553004), prostate cancer (NCT02854436), or any malignancy (except prostate) cancer (NCT03207347).

ACTOnco® + Report

A case report demonstrated an exceptional response to mitomycin C and cisplatin treatment in a gemcitabine-resistant pancreatic cancer patient with biallelic inactivation of PALB2^[79].

TSC2 Heterozygous deletion

Biological Impact

The tuberous sclerosis complex 2 (TSC2) gene encodes a protein called tuberin, which interact with a protein called hamartin (encoded by the TSC1 gene). This hamartin-tuberin tumor suppressor complex plays a critical role in growth control as a negative regulator of the mammalian target of rapamycin (mTOR) pathway^{[80][81]}. Mutations in TSC1/TSC2 tumor suppressor genes that result in inactivation of the complex are commonly found in patients with tuberous sclerosis complex^{[82][83][84]}, while the loss of heterozygosity (LOH) in TSC1/TSC2 has been identified in head and neck squamous cell carcinoma (HNSCC)^[85] and endometrial cancer^[86]. TSC2 deletion, splicing-mutant, and inactivating mutations such as A1141T, G305V, S1514X, and R1032X, has been identified in TSC2-null hepatocellular carcinoma (HCC) cell lines, patient-derived xenograft, and primary tumors. Mutations in the TSC1 and TSC2 genes cause the autosomal dominant genetic disorder tuberous sclerosis complex (TSC)^[87].

Therapeutic and prognostic relevance

Genomic alterations with activating effects of the mTOR signaling pathway (including deletion/inactivation of TSC1/TSC2) have been shown to confer sensitivity to everolimus across multiple cancer types, such as bladder cancer, gastric cancer, sarcoma, thyroid cancer, hepatocellular carcinoma (HCC) as well as head and neck squamous cell carcinoma (HNSCC)^{[88][89][90]}. Results from one Phase II study of advanced endometrial cancer showed that mutations in AKT1, TSC1, and TSC2 might predict sensitivity to temsirolimus^[91]. Recent studies indicated that there are mTORC1-independent signaling pathways downstream of hamartin-tuberin, which may represent new therapeutic targets^[92].

Everolimus has been approval by the U.S. FDA for Tuberous Sclerosis Complex (TSC)-associated renal angiomyolipoma and Tuberous Sclerosis Complex (TSC)-associated subependymal giant cell astrocytoma (SEGA). This approval is based on the results from EXIST-1, EXIST-2, and Study 2485 trials (NCT00789828, NCT00790400, and NCT00411619).

ACTOnco® + Report

US FDA-APPROVED DRUG(S)

Everolimus (AFINITOR)

Everolimus, a derivative of sirolimus, works as an inhibitor of mammalian target of rapamycin complex 1 (mTORC1) and blocks mTORC1-mediated downstream signals for cell growth, proliferation, and survival. Everolimus is developed and marketed by Novartis under the trade name AFINITOR.

- FDA Approval Summary of Everolimus (AFINITOR)

RADIANT-4 ^[93]	Lung or gastrointestinal neuroendocrine tumor (Approved on 2016/02/26)
NCT01524783	
NC101324763	Everolimus vs. Placebo [PFS(M): 11 vs. 3.9]
BOLERO-2 ^[94]	Breast cancer (Approved on 2012/07/20)
NCT00863655	ER+/HER2-
140100000000	Everolimus + exemestane vs. Placebo + exemestane [PFS(M): 7.8 vs. 3.2]
EXIST-2	Tuberous sclerosis complex (tsc)-associated renal angiomyolipoma (Approved on 2012/04/26)
NCT00790400	
	Everolimus vs. Placebo [ORR(%): 41.8 vs. 0]
DADIANT 2[95]	Pancreatic neuroendocrine tumor (Approved on 2011/05/05)
RADIANT-3 ^[95] NCT00510068	-
NC100510006	Everolimus vs. Placebo [PFS(M): 11 vs. 4.6]
EXIST-1 ^[96]	Subependymal giant cell astrocytoma (Approved on 2010/10/29)
NCT00789828	-
140100709020	Everolimus vs. Placebo [ORR(%): 35.0]
RECORD-1 ^[97]	Renal cell carcinoma (Approved on 2009/05/30)
NCT00410124	-
NC100410124	Everolimus vs. Placebo [PFS(M): 4.9 vs. 1.9]

Lapatinib (TYKERB)

Lapatinib is a dual tyrosine kinase inhibitor that interrupts the HER2/neu and epidermal growth factor receptor (EGFR) pathways. Lapatinib is developed and marketed by GlaxoSmithKline under the trade name TYKERB.

- FDA Approval Summary of Lapatinib (TYKERB)

[98]	Her2-receptor positive breast cancer (Approved on 2010/01/29)
	ER+/HER2+
NCT00073528	Lapatinib + letrozole vs. Letrozole [PFS(W): 35.4 vs. 13]
[99]	Her2-receptor positive breast cancer (Approved on 2007/03/13)
NCT00078572	HER2+
	Lapatinib + capecitabine vs. Capecitabine [TTP(W): 27.1 vs. 18.6]

Sorafenib (NEXAVAR)

Sorafenib is a small molecule multi-kinase inhibitor that targets multiple kinase families including VEGFR, PDGFRB, and the RAF family kinases. Sorafenib is co-developed and co-marketed by Bayer HealthCare Pharmaceuticals and Onyx Pharmaceuticals under the trade name NEXAVAR.

- FDA Approval Summary of Sorafenib (NEXAVAR)

DECISION ^[112]	Differentiated thyroid carcinoma (Approved on 2013/11/22)
NCT00984282	
NC100904202	Sorafenib vs. Placebo [PFS(M): 10.8 vs. 5.8]
SHARP[113]	Hepatocellular carcinoma (Approved on 2007/11/16)
NCT00105443	
NC100105445	Sorafenib vs. Placebo [OS(M): 10.7 vs. 7.9]
TADOET[114]	Renal cell carcinoma (Approved on 2005/12/20)
TARGET[114]	
NCT00073307	Sorafenib vs. Placebo [PFS(D): 167 vs. 84]

Talazoparib (TALZENNA)

Talazoparib is an inhibitor of poly (ADP-ribose) polymerase (PARP) enzymes, including PARP1 and PARP2. Talazoparib is developed and marketed by Pfizer under the trade name TALZENNA.

- FDA Approval Summary of Talazoparib (TALZENNA)

EMBRACA ^[115]	Breast cancer (Approved on 2018/10/16)
	HER2-/gBRCA mutation
NCT01945775	Talazoparib vs. Chemotherapy [PFS(M): 8.6 vs. 5.6]

Temsirolimus (TORISEL)

Temsirolimus is a soluble ester of sirolimus (rapamycin, brand-name drug Rapamune) and functions as an inhibitor of mammalian target of rapamycin complex (mTORC). The inhibitory molecular mechanism is similar to Everolimus. Temsirolimus is developed by Wyeth Pharmaceuticals and marketed by Pfizer under the trade name TORISEL.

- FDA Approval Summary of Temsirolimus (TORISEL)

[116]	Renal cell carcinoma (Approved on 2007/05/30)
	-
NCT00065468	Temsirolimus vs. Ifn-α [OS(M): 10.9 vs. 7.3]

Note:

- This table enlists variants detected by the panel other than those with clinical relevance (reported in Testing Result section).

The clinical impact of a genetic variant is determined according to ACT Genomics in-house clinical knowledge database. A negative result does not necessarily indicate absence of biological effect on the tumor. Some variants listed here may possibly have preclinical data or may show potential clinical relevance in the future.

Project ID: C22-M001-02717 Report No.: AA-22-05182 ONC

Date Reported: Sep 19, 2022

LIMITATIONS

- This test does not provide information of variant causality and does not detect variants in non-coding regions that could affect gene expression. This report does not report polymorphisms and we do not classify whether a mutation is germline or somatic. Variants identified by this assay were not subject to validation by Sanger or other technologies.
- The possibility cannot be excluded that certain pathogenic variants detected by other sequencing tools may not be reported in the test because of technical limitation of bioinformatics algorithm or the NGS sequencing platform, e.g. low coverage.
- This test has been designed to detect fusions in 13 genes sequenced. Therefore, fusion in genes not covered by this test would not be reported. For novel fusions detected in this test, Sanger sequencing confirmation is recommended if residue specimen is available

NEXT-GENERATION SEQUENCING (NGS) METHODS

Extracted genomic DNA was amplified using primers targeting coding exons of analyzed genes and subjected to library construction. Barcoded libraries were subsequently conjugated with sequencing beads by emulsion PCR and enriched using Ion Chef system. Sequencing was performed according to Ion Proton or Ion S5 sequencer protocol (Thermo Fisher Scientific).

Raw reads generated by the sequencer were mapped to the hg19 reference genome using the Ion Torrent Suite. Coverage depth was calculated using Torrent Coverage Analysis plug-in. Single nucleotide variants (SNVs) and short insertions/deletions (InDels) were identified using the Torrent Variant Caller plug-in. VEP (Variant Effect Predictor) was used to annotate every variant using databases from Clinvar, COSMIC and Genome Aggregation database. Variants with coverage ≥ 20, allele frequency ≥ 5% and actionable variants with allele frequency ≥ 2% were retained. This test provides uniform coverage of the targeted regions, enabling target base coverage at 100x ≥ 85% with a mean coverage ≥ 500x.

Variants reported in Genome Aggregation database with > 1% minor allele frequency (MAF) were considered as polymorphisms. ACT Genomics in-house database was used to determine technical errors. Clinically actionable and biologically significant variants were determined based on the published medical literature.

The copy number alterations (CNAs) were predicted as described below:

Amplicons with read counts in the lowest 5th percentile of all detectable amplicons and amplicons with a coefficient of variation ≥ 0.3 were removed. The remaining amplicons were normalized to correct the pool design bias. ONCOCNV (an established method for calculating copy number aberrations in amplicon sequencing data by Boeva et al., 2014) was applied for the normalization of total amplicon number, amplicon GC content, amplicon length, and technology-related biases, followed by segmenting the sample with a gene-aware model. The method was used as well for establishing the baseline of copy number variations.

Tumor mutational burden (TMB) was calculated by using the sequenced regions of ACTOnco®+ to estimate the number of somatic nonsynonymous mutations per megabase of all protein-coding genes (whole exome). The TMB calculation predicted somatic variants and applied a machine learning model with a cancer hotspot correction. TMB may be reported as "TMB-High", "TMB-Low" or "Cannot Be Determined". TMB-High corresponds to ≥ 7.5 mutations per megabase (Muts/Mb); TMB-Low corresponds to < 7.5 Muts/Mb. TMB is reported as "Cannot Be Determined" if the tumor purity of the sample is < 30%.

Classification of microsatellite instability (MSI) status is determined by a machine learning prediction algorithm. The change of a number of repeats of different lengths from a pooled microsatellite stable (MSS) baseline in > 400 genomic loci are used as the features for the algorithm. The final output of the results is either microsatellite Stable (MSS) or microsatellite instability high (MSI-H).

ACTOnco® + Report

RNA test

Extracted RNA was reverse-transcribed and subjected to library construction. Sequencing was performed according to lon Proton or lon S5 sequencer protocol (Thermo Fisher Scientific). To ensure sequencing quality for fusion variant analysis, the average unique RNA Start Sites (SS) per control Gene Specific Primer 2 (GSP 2) should be ≥ 10.

The fusion analysis pipeline aligned sequenced reads to the human reference genome, identified regions that map to noncontiguous regions of the genome, applied filters to exclude probable false-positive events and, annotated previously characterized fusion events according to Quiver Gene Fusion Database, a curated database owned and maintained by ArcherDX. In general, samples with detectable fusions need to meet the following criteria: (1) Number of unique start sites (SS) for the GSP2 \geq 3; (2) Number of supporting reads spanning the fusion junction \geq 5; (3) Percentage of supporting reads spanning the fusion junction \geq 10%; (4) Fusions annotated in Quiver Gene Fusion Database.

DATABASE USED

- Reference genome: Human genome sequence hg19
- COSMIC v.92
- Genome Aggregation database r2.1.1
- ClinVar (version 20210404)
- ACT Genomics in-house database
- Quiver Gene Fusion Database version 5.1.18

DISCLAIMER

法律聲明

本檢驗報告僅提供專業醫療參考,結果需經專業醫師解釋及判讀。基因突變資訊非必具備藥物或治療有效性指標,反之亦然。本檢驗報 告提供之用藥指引不聲明或保證其臨床有效性,反之亦然。本基因檢測方法係由本公司研究開發,已經過有效性測試。

本檢驗報告非經本公司許可,不得私自變造、塗改,或以任何方式作為廣告及其他宣傳之用途。

本公司於提供檢驗報告後,即已完成本次契約義務,後續之報告解釋、判讀及用藥、治療,應自行尋求相關專業醫師協助,若需將報告 移件其他醫師,本人應取得該醫師同意並填寫移件申請書,主動告知行動基因,行動基因僅能配合該醫師意願與時間提供醫師解說。

醫療決策需由醫師決定

任何治療與用藥需經由醫師在考慮病患所有健康狀況相關資訊包含健檢、其他檢測報告和病患意願後,依照該地區醫療照護標準由醫師獨立判斷。醫師不應僅依據單一報告結果(例如本檢測或本報告書內容)做決策。

基因突變與用藥資訊並非依照有效性排序

本報告中列出之生物標記變異與藥物資訊並非依照潛在治療有效性排序。

證據等級

藥物潛在臨床效益(或缺乏潛在臨床效益)的實證證據是依據至少一篇臨床療效個案報告或臨床前試驗做為評估。本公司盡力提供適時及 準確之資料,但由於醫學科技之發展日新月異,本公司不就本報告提供的資料是否為準確、適宜或最新作保證。

責任

本檢驗報告僅提供專業醫療參考,本公司及其員工不對任何由使用本報告之內容引起的直接、間接、特殊、連帶或衍生的損失或損害承擔責任。

行動基因僅提供技術檢測服務及檢測報告,檢測結果之臨床解釋及相關醫療處置,請諮詢專業醫師。報告結果僅對此試驗件有效。 行動基因臨床分子醫學實驗室 台北市內湖區新湖二路345號3F

REFERENCE

- PMID: 9734785; 1998, Genes Cells;3(6):395-403
 Axin, an inhibitor of the Wnt signalling pathway, interacts with beta-catenin, GSK-3beta and APC and reduces the beta-catenin level.
- 2. PMID: 23169527; 2013, Cold Spring Harb Perspect Biol;5(1):a007898 The β -catenin destruction complex.
- PMID: 12101426; 2002, Oncogene; 21(31):4863-71
 Mutational spectrum of beta-catenin, AXIN1, and AXIN2 in hepatocellular carcinomas and hepatoblastomas.
- PMID: 12555076; 2003, Oncogene;22(4):632-6
 AXIN1 mutations but not deletions in cerebellar medulloblastomas.
- PMID: 11585731; 2001, Cancer Res;61(19):7039-43
 Deletions of AXIN1, a component of the WNT/wingless pathway, in sporadic medulloblastomas.
- PMID: 25236910; 2014, Cancer Lett;355(1):1-8
 AXIN1 and AXIN2 variants in gastrointestinal cancers.
- PMID: 14566817; 2003, Int J Cancer;107(5):696-9
 Detection of point mutations of the Axin1 gene in colorectal cancers.
- PMID: 19582507; 2009, Ann Surg Oncol;16(9):2486-93
 Reduced axin protein expression is associated with a poor prognosis in patients with squamous cell carcinoma of esophagus.
- PMID: 19536107; 2009, Nat Rev Cancer;9(7):463-75
 Novel anticancer targets: revisiting ERBB2 and discovering ERBB3.
- PMID: 9130710; 1997, EMBO J;16(7):1647-55
 ErbB-2, the preferred heterodimerization partner of all ErbB receptors, is a mediator of lateral signaling.
- PMID: 22785351; 2012, Nat Rev Cancer;12(8):553-63
 The ERBB network: at last, cancer therapy meets systems biology.
- PMID: 7515147; 1994, Mol Cell Biol;14(6):3550-8
 ErbB3 is involved in activation of phosphatidylinositol 3-kinase by epidermal growth factor.
- PMID: 12853564; 2003, Proc Natl Acad Sci U S A;100(15):8933-8
 The ErbB2/ErbB3 heterodimer functions as an oncogenic unit: ErbB2 requires ErbB3 to drive breast tumor cell proliferation.
- PMID: 19208461; 2009, Curr Opin Cell Biol;21(2):177-84
 ErbB receptors and signaling pathways in cancer.
- PMID: 23680147; 2013, Cancer Cell;23(5):603-17
 Oncogenic ERBB3 mutations in human cancers.
- PMID: 18698037; 2008, Clin Cancer Res;14(16):5188-97
 HER3 is a determinant for poor prognosis in melanoma.
- 17. PMID: 20647770; 2010, Cancer Biol Ther;10(6):555-63
 ErbB3 expression promotes tumorigenesis in pancreatic adenocarcinoma.
- PMID: 30057690; 2018, Oncol Rev;12(1):355
 HER3 signaling and targeted therapy in cancer.
- PMID: 30109175; 2018, Acta Pharm Sin B;8(4):503-510
 Understanding the biology of HER3 receptor as a therapeutic target in human cancer.

ACTOnco® + Report

- 20. PMID: 25216528; 2014, Oncotarget;5(16):7138-48
 HER3 as biomarker and therapeutic target in pancreatic cancer: new insights in pertuzumab therapy in preclinical models.
- PMID: 27044931; 2016, J Clin Oncol;34(18):2165-71
 Afatinib Activity in Platinum-Refractory Metastatic Urothelial Carcinoma in Patients With ERBB Alterations.
- 22. PMID: 29902295; 2018, JAMA Oncol;4(9):1189-1197 Association of ERBB Mutations With Clinical Outcomes of Afatinib- or Erlotinib-Treated Patients With Lung Squamous Cell Carcinoma: Secondary Analysis of the LUX-Lung 8 Randomized Clinical Trial.
- 23. PMID: 32323774; 2020, Oncol Rep;43(4):1089-1102
 Targeted deep sequencing contributes to guiding personalized targeted therapy for advanced biliary tract cancer patients with non_radical resection: A real_world study.
- PMID: 15498494; 2004, Curr Biol;14(20):1852-7
 A nucleolar isoform of the Fbw7 ubiquitin ligase regulates c-Myc and cell size.
- PMID: 15103331; 2004, EMBO J;23(10):2116-25
 Phosphorylation-dependent degradation of c-Myc is mediated by the F-box protein Fbw7.
- 26. PMID: 16023596; 2005, Cancer Cell;8(1):25-33
 The v-Jun point mutation allows c-Jun to escape GSK3-dependent recognition and destruction by the Fbw7 ubiquitin ligase.
- PMID: 11533444; 2001, Science;294(5540):173-7
 Phosphorylation-dependent ubiquitination of cyclin E by the SCFFbw7 ubiquitin ligase.
- PMID: 11461910; 2001, J Biol Chem;276(38):35847-53
 The Notch intracellular domain is ubiquitinated and negatively regulated by the mammalian Sel-10 homolog.
- PMID: 11425854; 2001, J Biol Chem;276(37):34371-8
 Functional interaction between SEL-10, an F-box protein, and the nuclear form of activated Notch1 receptor.
- PMID: 16863506; 2006, Cancer Sci;97(8):729-36
 Fbxw7 contributes to tumor suppression by targeting multiple proteins for ubiquitin-dependent degradation.
- PMID: 18787170; 2008, Science;321(5895):1499-502
 FBXW7 targets mTOR for degradation and cooperates with PTEN in tumor suppression.
- 32. PMID: 20484041; 2010, Cancer Res;70(11):4728-38
 The Fbw7 tumor suppressor targets KLF5 for ubiquitin-mediated degradation and suppresses breast cell proliferation.
- PMID: 21368833; 2011, Nature;471(7336):104-9
 SCF(FBW7) regulates cellular apoptosis by targeting MCL1 for ubiquitylation and destruction.
- PMID: 18094723; 2008, Nat Rev Cancer;8(2):83-93
 FBW7 ubiquitin ligase: a tumour suppressor at the crossroads of cell division, growth and differentiation.
- 35. PMID: 23032637; 2012, Cancer Inform;11():157-71 Haploinsufficiency of Tumor Suppressor Genes is Driven by the Cumulative Effect of microRNAs, microRNA Binding Site Polymorphisms and microRNA Polymorphisms: An In silico Approach.
- 36. PMID: 24586741; 2014, PLoS One;9(2):e89388 FBXW7 mutations in patients with advanced cancers: clinical and molecular characteristics and outcomes with mTOR inhibitors.
- PMID: 24360397; 2014, Lung Cancer;83(2):300-1
 Temsirolimus therapy in a patient with lung adenocarcinoma harboring an FBXW7 mutation.
- PMID: 27399335; 2017, Oncogene;36(6):787-796
 FBW7 mutations mediate resistance of colorectal cancer to targeted therapies by blocking Mcl-1 degradation.

sequence 1 (Mcl-1).

- PMID: 24763611; 2014, Clin Cancer Res;20(13):3472-84
 Regorafenib inhibits colorectal tumor growth through PUMA-mediated apoptosis.
- 59. PMID: 26561209; 2015, Cancer Biol Ther;16(12):1710-9 Regorafenib with a fluoropyrimidine for metastatic colorectal cancer after progression on multiple 5-FU-containing combination therapies and regorafenib monotherapy.
- 60. PMID: 24163374; 2014, Cancer Discov;4(1):42-52 mTOR inhibition specifically sensitizes colorectal cancers with KRAS or BRAF mutations to BCL-2/BCL-XL inhibition by suppressing MCL-1.
- 61. PMID: 24162815; 2013, Nat Med;19(11):1469-1472
 Oncogenic and drug-sensitive NTRK1 rearrangements in lung cancer.
- 62. PMID: 27843590; 2016, ESMO Open;1(2):e000023
 NTRK gene fusions as novel targets of cancer therapy across multiple tumour types.
- PMID: 30624546; 2019, Ann Oncol;30(2):325-331
 Larotrectinib in adult patients with solid tumours: a multi-centre, open-label, phase I dose-escalation study.
- PMID: 32323889; 2020, Oncologist;25(6):e881-e886
 Antitumor Activity of Larotrectinib in Esophageal Carcinoma with NTRK Gene Amplification.
- PMID: 16793542; 2006, Mol Cell;22(6):719-29
 Control of BRCA2 cellular and clinical functions by a nuclear partner, PALB2.
- PMID: 23325218; 2013, Nature;493(7432):356-63
 Fanconi anaemia and the repair of Watson and Crick DNA crosslinks.
- 67. PMID: 15905196; 2005, Carcinogenesis;26(10):1731-40

 The Fanconi anemia group A protein modulates homologous repair of DNA double-strand breaks in mammalian cells.
- PMID: 27037238; 2016, EMBO J;35(9):909-23
 Interplay between Fanconi anemia and homologous recombination pathways in genome integrity.
- PMID: 24153426; 2013, Nat Commun;4():2578
 Heterozygous mutations in PALB2 cause DNA replication and damage response defects.
- PMID: 20858716; 2010, Cancer Res;70(19):7353-9
 PALB2/FANCN: recombining cancer and Fanconi anemia.
- PMID: 25754594; 2015, Hum Mutat;36(5):562-8
 Loss-of-Function FANCL Mutations Associate with Severe Fanconi Anemia Overlapping the VACTERL Association.
- 72. PMID: 28678401; 2017, Cancer;123(20):3943-3954
 Assessing the spectrum of germline variation in Fanconi anemia genes among patients with head and neck carcinoma before age 50.
- PMID: 32343890; 2020, N Engl J Med;382(22):2091-2102
 Olaparib for Metastatic Castration-Resistant Prostate Cancer.
- 74. PMID: 33970687; 2021, J Clin Oncol;39(22):2497-2505 Phase II Study of Maintenance Rucaparib in Patients With Platinum-Sensitive Advanced Pancreatic Cancer and a Pathogenic Germline or Somatic Variant in BRCA1, BRCA2, or PALB2.
- 75. PMID: 28242752; 2017, Cancer Discov;7(6):620-629
 Phase I, Dose-Escalation, Two-Part Trial of the PARP Inhibitor Talazoparib in Patients with Advanced Germline BRCA1/2 Mutations and Selected Sporadic Cancers.
- 76. PMID: 25263539; 2015, Pediatr Blood Cancer;62(1):91-8

ACTOnco® + Report

Initial testing (stage 1) of the PARP inhibitor BMN 673 by the pediatric preclinical testing program: PALB2 mutation predicts exceptional in vivo response to BMN 673.

77. PMID: 28916367; 2017, Lancet;390(10106):1949-1961

Rucaparib maintenance treatment for recurrent ovarian carcinoma after response to platinum therapy (ARIEL3): a randomised, double-blind, placebo-controlled, phase 3 trial.

78. PMID: 32086346; 2020, Clin Cancer Res;26(11):2487-2496

Non-BRCA DNA Damage Repair Gene Alterations and Response to the PARP Inhibitor Rucaparib in Metastatic Castration-Resistant Prostate Cancer: Analysis From the Phase II TRITON2 Study.

79. PMID: 21135251; 2011, Mol Cancer Ther;10(1):3-8

Personalizing cancer treatment in the age of global genomic analyses: PALB2 gene mutations and the response to DNA damaging agents in pancreatic cancer.

80. PMID: 21157483; 2011, Nat Rev Mol Cell Biol;12(1):21-35

mTOR: from growth signal integration to cancer, diabetes and ageing.

81. PMID: 12271141; 2002, Proc Natl Acad Sci U S A;99(21):13571-6

Tuberous sclerosis complex-1 and -2 gene products function together to inhibit mammalian target of rapamycin (mTOR)-mediated downstream signaling.

82. PMID: 9242607; 1997, Science;277(5327):805-8

Identification of the tuberous sclerosis gene TSC1 on chromosome 9q34.

83. PMID: 8269512; 1993, Cell;75(7):1305-15

Identification and characterization of the tuberous sclerosis gene on chromosome 16.

84. PMID: 1303246; 1992, Nat Genet;2(1):37-41

Linkage of an important gene locus for tuberous sclerosis to a chromosome 16 marker for polycystic kidney disease.

85. PMID: 18538015; 2008, BMC Cancer;8():163

Involvement of TSC genes and differential expression of other members of the mTOR signaling pathway in oral squamous cell carcinoma.

86. PMID: 28339086; 2017, Int J Oncol;50(5):1778-1784

Identification of novel mutations in endometrial cancer patients by whole-exome sequencing.

87. PMID: 17005952; 2006, N Engl J Med;355(13):1345-56

The tuberous sclerosis complex.

88. PMID: 22923433; 2012, Science;338(6104):221

Genome sequencing identifies a basis for everolimus sensitivity.

89. PMID: 26859683; 2016, Oncotarget;7(9):10547-56

Next-generation sequencing reveals somatic mutations that confer exceptional response to everolimus.

90. PMID: 25724664; 2015, Mol Cancer Ther;14(5):1224-35

Loss of Tuberous Sclerosis Complex 2 (TSC2) Is Frequent in Hepatocellular Carcinoma and Predicts Response to mTORC1 Inhibitor Everolimus.

91. PMID: 27016228; 2016, Gynecol Oncol;141(1):43-8

Tumor mutational analysis of GOG248, a phase II study of temsirolimus or temsirolimus and alternating megestrol acetate and tamoxifen for advanced endometrial cancer (EC): An NRG Oncology/Gynecologic Oncology Group study.

92. PMID: 26412398; 2015, Sci Rep;5():14534

PAK2 is an effector of TSC1/2 signaling independent of mTOR and a potential therapeutic target for Tuberous Sclerosis Complex.

93. PMID: 26703889; 2016, Lancet; 387(10022): 968-977

Everolimus for the treatment of advanced, non-functional neuroendocrine tumours of the lung or gastrointestinal tract (RADIANT-4): a randomised, placebo-controlled, phase 3 study.

- PMID: 22149876; 2012, N Engl J Med;366(6):520-9
 Everolimus in postmenopausal hormone-receptor-positive advanced breast cancer.
- PMID: 21306238; 2011, N Engl J Med;364(6):514-23
 Everolimus for advanced pancreatic neuroendocrine tumors.
- 96. PMID: 23158522; 2013, Lancet;381(9861):125-32
 Efficacy and safety of everolimus for subependymal giant cell astrocytomas associated with tuberous sclerosis complex (EXIST-1): a multicentre, randomised, placebo-controlled phase 3 trial.
- 97. PMID: 18653228; 2008, Lancet;372(9637):449-56
 Efficacy of everolimus in advanced renal cell carcinoma: a double-blind, randomised, placebo-controlled phase III trial.
- PMID: 20156908; 2010, Oncologist;15(2):122-9
 Lapatinib plus letrozole as first-line therapy for HER-2+ hormone receptor-positive metastatic breast cancer.
- PMID: 17192538; 2006, N Engl J Med;355(26):2733-43
 Lapatinib plus capecitabine for HER2-positive advanced breast cancer.
- 100. PMID: 30948273; 2019, Lancet Oncol;20(5):636-648
 Niraparib monotherapy for late-line treatment of ovarian cancer (QUADRA): a multicentre, open-label, single-arm, phase 2 trial.
- PMID: 27717299; 2016, N Engl J Med;375(22):2154-2164
 Niraparib Maintenance Therapy in Platinum-Sensitive, Recurrent Ovarian Cancer.
- PMID: 31851799; 2019, N Engl J Med;381(25):2416-2428
 Olaparib plus Bevacizumab as First-Line Maintenance in Ovarian Cancer.
- PMID: 31157963; 2019, N Engl J Med;381(4):317-327
 Maintenance Olaparib for Germline BRCA-Mutated Metastatic Pancreatic Cancer.
- PMID: 30345884; 2018, N Engl J Med;379(26):2495-2505
 Maintenance Olaparib in Patients with Newly Diagnosed Advanced Ovarian Cancer.
- PMID: 28578601; 2017, N Engl J Med;377(6):523-533
 Olaparib for Metastatic Breast Cancer in Patients with a Germline BRCA Mutation.
- 106. PMID: 28754483; 2017, Lancet Oncol;18(9):1274-1284

 Olaparib tablets as maintenance therapy in patients with platinum-sensitive, relapsed ovarian cancer and a BRCA1/2 mutation (SOLO2/ENGOT-Ov21): a double-blind, randomised, placebo-controlled, phase 3 trial.
- 107. PMID: 27617661; 2016, Lancet Oncol;17(11):1579-1589
 Overall survival in patients with platinum-sensitive recurrent serous ovarian cancer receiving olaparib maintenance monotherapy: an updated analysis from a randomised, placebo-controlled, double-blind, phase 2 trial.
- 108. PMID: 25366685; 2015, J Clin Oncol;33(3):244-50
 Olaparib monotherapy in patients with advanced cancer and a germline BRCA1/2 mutation.
- 109. PMID: 27932229; 2017, Lancet;389(10064):56-66 Regorafenib for patients with hepatocellular carcinoma who progressed on sorafenib treatment (RESORCE): a randomised, double-blind, placebo-controlled, phase 3 trial.
- 110. PMID: 23177515; 2013, Lancet;381(9863):295-302 Efficacy and safety of regorafenib for advanced gastrointestinal stromal tumours after failure of imatinib and sunitinib (GRID): an international, multicentre, randomised, placebo-controlled, phase 3 trial.
- 111. PMID: 23177514; 2013, Lancet;381(9863):303-12 Regorafenib monotherapy for previously treated metastatic colorectal cancer (CORRECT): an international, multicentre, randomised, placebo-controlled, phase 3 trial.

ACTOnco® + Report

- 112. PMID: 24768112; 2014, Lancet;384(9940):319-28

 Sorafenib in radioactive iodine-refractory, locally advanced or metastatic differentiated thyroid cancer: a randomised, double-blind, phase 3
- PMID: 18650514; 2008, N Engl J Med;359(4):378-90
 Sorafenib in advanced hepatocellular carcinoma.
- 114. PMID: 17189398; 2006, Clin Cancer Res;12(24):7271-8
 Sorafenib for the treatment of advanced renal cell carcinoma.
- 115. PMID: 30110579; 2018, N Engl J Med;379(8):753-763
 Talazoparib in Patients with Advanced Breast Cancer and a Germline BRCA Mutation.
- PMID: 17538086; 2007, N Engl J Med;356(22):2271-81
 Temsirolimus, interferon alfa, or both for advanced renal-cell carcinoma.
