Project ID: C23-M001-01364 Report No.: AA-23-02856\_ONC Date Reported: May 19, 2023

## ACTOnco® + Report

PATIENT	
Identifier: 楊子頤	Patient ID: 49466731
Date of Birth: Feb 15, 2019	Gender: Male
Diagnosis: Pilocytic astrocytoma	
ORDERING PHYSICIAN	
Name: 李致穎醫師	Tel: 886-228712121
Facility: 臺北榮總	
Address: 臺北市北投區石牌路二段 201 號	
SPECIMEN	
Specimen ID: S11219116A Collection site: Cerebrum	Type: FFPE tissue
Date received: May 09, 2023 Lab ID: AA-23-02856	D/ID: NA

#### ABOUT ACTOnco®+

The test is a next-generation sequencing (NGS)-based assay developed for efficient and comprehensive genomic profiling of cancers. This test interrogates coding regions of 440 genes associated with cancer treatment, prognosis and diagnosis. Genetic mutations detected by this test include small-scale mutations like single nucleotide variants (SNVs), small insertions and deletions (InDels) (≤ 15 nucleotides) and large-scale genomic alterations like copy number alterations (CNAs). The test also includes an RNA test, detecting fusion transcripts of 13 genes.

## SUMMARY FOR ACTIONABLE VARIANTS VARIANTS/BIOMARKERS WITH EVIDENCE OF CLINICAL SIGNIFICANCE

Genomic	Probable Effects in P	atient's Cancer Type	Probable Sensitive in Other
Alterations/Biomarkers	Sensitive	Resistant	Cancer Types
BRAF V600E	Dabrafenib, Trametinib, Cobimetinib, Vemurafenib.	_	Binimetinib, Encorafenib
DIVII VOOCE	Selumetinib		Billinothis, Ellocialenis

### VARIANTS/BIOMARKERS WITH POTENTIAL CLINICAL SIGNIFICANCE

Genomic Alterations/Biomarkers	Possibly Sensitive	Possibly Resistant
BRAF V600E	-	Cetuximab, Panitumumab

#### Note:

- The above summary tables present genomic variants and biomarkers based on the three-tiered approach proposed by US FDA for reporting tumor profiling NGS testing. "Variants/biomarkers with evidence of clinical significance" refers to mutations that are widely recognized as standard-of-care biomarkers (FDA level 2/AMP tier 1). "Variants/biomarkers with potential clinical significance" refers to mutations that are not included in the standard of care but are informational for clinicians, which are commonly biomarkers used as inclusion criterial for clinical trials (FDA level 3/AMP tier 2).
- The therapeutic agents and possible effects to a given drug are based on mapping the variants/biomarkers with ACT Genomics clinical knowledge database. The mapping results only provide information for reference, but not medical recommendation.
- Please refer to corresponding sections for more detailed information about genomic alteration and clinical relevance listed above.

## ACTOnco® + Report

## **TESTING RESULTS**

## **VARIANT(S) WITH CLINICAL RELEVANCE**

### - Single Nucleotide and Small InDel Variants

Gene	Amino Acid Change	Allele Frequency
BRAF	V600E	32.3%

## - Copy Number Alterations

Chromosome	Gene	Variation	Copy Number
	Not	detected	

#### - Fusions

Fusion Gene & Exon		Transcript ID
	No fusion gene detected in this sample	

## - Immune Checkpoint Inhibitor (ICI) Related Biomarkers

Biomarker	Results
Tumor Mutational Burden (TMB)	0.7 muts/Mb
Microsatellite Instability (MSI)	Microsatellite stable (MSS)

#### Note:

- Loss of heterozygosity (LOH) information was used to infer tumor cellularity. Copy number alteration in the tumor was determined based on 60% tumor purity.
- TMB was calculated by using the sequenced regions of ACTOnco®+ to estimate the number of somatic nonsynonymous mutations per megabase of all protein-coding genes (whole exome). The threshold for high mutation load is set at ≥ 7.5 mutations per megabase. TMB, microsatellite status and gene copy number deletion cannot be determined if calculated tumor purity is < 30%.

## **ACTOnco® + Report**

## THERAPEUTIC IMPLICATIONS

#### **TARGETED THERAPIES**

Genomic Alterations	Therapies Effect	
Level 1		
<b>BRAF</b> V600E	Dabrafenib, Trametinib	sensitive
Level 2		
<b>BRAF</b> V600E	Cobimetinib, Vemurafenib, Selumetinib sensitive	
Level 3A		
BRAF V600E	Binimetinib, Encorafenib	sensitive
BRAF V600E	Cetuximab, Panitumumab	resistant

Therapies associated with benefit or lack of benefit are based on biomarkers detected in this tumor and published evidence in professional guidelines or peer-reviewed journals.

Level	Description
1	FDA-recognized biomarkers predictive of response or resistance to FDA approved drugs in this indication
2	Standard care biomarkers (recommended by the NCCN guideline) predictive of response or resistance to FDA approved drugs in this indication
ЗА	Biomarkers predictive of response or resistance to therapies approved by the FDA or NCCN guideline in a different cancer type
3B	Biomarkers that serve as inclusion criteria for clinical trials (minimal supportive data required)
4	Biomarkers that show plausible therapeutic significance based on small studies, few case reports, or preclinical studies

行動基因僅提供技術檢測服務及檢測報告,檢測結果之臨床解釋及相關醫療處置,請諮詢專業醫師。報告結果僅對此試驗件有效。 行動基因臨床分子醫學實驗室 台北市內湖區新湖二路345號3F

## ACTOnco® + Report

## **IMMUNE CHECKPOINT INHIBITORS (ICIs)**

No genomic alterations detected to confer sensitivity or lack of benefit to immune checkpoint therapies.

#### - Other Biomarkers with Potential Clinical Effects for ICIs

Genomic Alterations	Potential Clinical Effects
	Not detected

Note: Tumor non-genomic factors, such as patient germline genetics, PDL1 expression, tumor microenvironment, epigenetic alterations or other factors not provided by this test may affect ICI response.

#### **CHEMOTHERAPIES**

No genomic alterations detected in this tumor predicted to confer sensitivity or lack of benefit to chemotherapies.

#### **HORMONAL THERAPIES**

No genomic alterations detected in this tumor predicted to confer sensitivity or lack of benefit to hormonal therapies.

#### **OTHERS**

No genomic alterations detected in this tumor predicted to confer sensitivity or lack of benefit to other therapies.

#### Note:

Therapeutic implications provided in the test are based solely on the panel of 440 genes sequenced. Therefore, alterations in genes not covered in this panel, epigenetic and post-transcriptional and post-translational factors may also determine a patient's response to therapies. In addition, several other patient-associated clinical factors, including but not limited to, prior lines of therapies received, dosage and combinations with other therapeutic agents, patient's cancer types, sub-types, and/or stages, may also determine the patient's clinical response to therapies.

### VARIANT INTERPRETATION

#### **BRAF V600E**

#### **Biological Impact**

BRAF is a serine/threonine kinase that belongs to the RAF family. The protein plays an essential role in the regulation of mitogen-activated protein kinase (MAPK) cascade, which affects a range of cellular response including cell division, differentiation, and secretion[1][2]. Mutations in the BRAF gene, most commonly the V600 residue, are the most frequently identified oncogenic mutations in melanomas, and have been identified in several types of cancers including non-Hodgkin lymphoma, thyroid cancers, non-small cell lung carcinoma, hairy cell leukemia, glioma, gastrointestinal stromal tumor, and colorectal cancers (CRCs)[3][4]. Of note, in the vast majority of cases, BRAF mutations are nonoverlapping with other oncogenic mutations (e.g., NRAS mutations, KIT mutations, etc.) found in melanoma. V600E has been determined to be an activating mutation, which results in enhanced BRAF kinase activity and constitutive activation of downstream MEK/ERK signaling cascade<sup>[5][6]</sup>.

#### Therapeutic and prognostic relevance

In NCCN guidelines of melanoma, trametinib is recommended as a treatment option for patients harboring BRAF non-V600 mutations or BRAF fusions. In the NCCN guidelines for CNS cancers, selumetinib is recommended as a treatment option for recurrent or progressive circumscribed glioma patient harboring BRAF fusion.

BRAF activating mutations have been determined as an inclusion criterion for the trials evaluating selumetinib efficacies in cancers (NCT01089101, NCT00888134, NCT00866177, and NCT00936221). BRAF fusions have been determined as an inclusion criterion for the trials evaluating trametinib efficacies in cancers (NCT04439279).

FDA-approved drugs are available for treating BRAF V600E in various types of cancer. Dabrafenib is used as a single agent or in combination with trametinib for unresectable or metastatic melanoma with BRAF V600E. It is also approved for metastatic solid tumors (except CRC), NSCLC, anaplastic thyroid cancer, and low-grade glioma harboring BRAF V600E mutations. Encorafenib, in combination with binimetinib or cetuximab, is indicated for unresectable or metastatic melanoma and metastatic colorectal cancer with BRAF V600E mutations. Vemurafenib is used as a single agent or in combination with cobimetinib for unresectable or metastatic melanoma harboring BRAF V600E mutations. Trametinib can be used for unresectable or metastatic melanoma harboring BRAF V600E.

In NCCN guidelines for colorectal cancer, encorafenib in combination with cetuximab or panitumumab are recommended for patients with BRAF V600E. The NCCN guidelines recommend selumetinib, vemurafenib in combination with cobimetinib, or dabrafenib in combination with trametinib for circumscribed gliomas harboring BRAF V600E mutation. Dabrafenib in combination with trametinib is also recommended by NCCN as a treatment option in NSCLC or biliary tract cancer patients harboring BRAF V600E mutation. Vemurafenib or dabrafenib as a single agent is also recommended by NCCN as a treatment option for NSCLC patients with BRAF V600E mutation.

BRAF mutations (e.g., G469A and V600E) can cause resistance to EGFR TKIs in 1-2% of cases. This resistance was confirmed by ectopic expression of mutated BRAF in drug-sensitive EGFR-mutant cells and can be overcome with a MEK inhibitor<sup>[7][8][7]</sup>. Targeting with BRAF V600E mutations have also been evaluated in endometrial adenocarcinoma and salivary duct carcinoma patients[9][10].

## ACTOnco® + Report

## **US FDA-APPROVED DRUG(S)**

### Binimetinib (MEKTOVI)

Binimetinib is an oral kinase inhibitor that targets MEK. Binimetinib is developed and marketed by Array BioPharma under the trade name MEKTOVI.

## - FDA Approval Summary of Binimetinib (MEKTOVI)

NATIVE OV ([11])	Melanoma (Approved on 2018/06/27)
MEKTOVI <sup>[11]</sup>	BRAF V600E/K
NCT01909453	Encorafenib + binimetinib vs. Vemurafenib [PFS(M): 14.9 vs. 7.3]

### Cobimetinib (COTELLIC)

Cobimetinib is a reversible inhibitor which targets MEK1 and MEK2. Cobimetinib is developed by Exelixis and Genentech, and marketed by Genentech under the trade name COTELLIC.

## - FDA Approval Summary of Cobimetinib (COTELLIC)

coBRIM <sup>[12]</sup>	Melanoma (Approved on 2015/11/10)
NCT01689519	BRAF V600E/K
NC101009519	Cobimetinib + vemurafenib vs. Placebo + vemurafenib [PFS(M): 12.3 vs. 7.2]

#### Dabrafenib (TAFINLAR)

Dabrafenib is a reversible ATP-competitive kinase inhibitor of the enzyme B-Raf, which plays a role in the regulation of cell growth via the ERK signaling cascade. Dabrafenib is developed and marketed by GlaxoSmithKline under the trade name TAFINLAR.

## - FDA Approval Summary of Dabrafenib (TAFINLAR)

CDRB436G2201	Low-grade glioma (Approved on 2023/03/09)					
NCT02684058	BRAF V600E					
NC102004030	Dabrafenib + trametinib vs. Carboplatin + vincristine [ORR(%): 46.6 vs. 10.8]					
BRF117019, NCI-MATCH,	Cancer (Approved on 2022/06/22)					
CTMT212X2101	BRAF V600E

#### Note:

- This table enlists variants detected by the panel other than those with clinical relevance (reported in Testing Result section).

The clinical impact of a genetic variant is determined according to ACT Genomics in-house clinical knowledge database. A negative result does not necessarily indicate absence of biological effect on the tumor. Some variants listed here may possibly have preclinical data or may show potential clinical relevance in the future.

Project ID: C23-M001-01364 Report No.: AA-23-02856 ONC Date Reported: May 19, 2023

#### LIMITATIONS

- This test does not provide information of variant causality and does not detect variants in non-coding regions that could affect gene expression. This report does not report polymorphisms and we do not classify whether a mutation is germline or somatic. Variants identified by this assay were not subject to validation by Sanger or other technologies.
- The possibility cannot be excluded that certain pathogenic variants detected by other sequencing tools may not be reported in the test because of technical limitation of bioinformatics algorithm or the NGS sequencing platform, e.g. low coverage.
- This test has been designed to detect fusions in 13 genes sequenced. Therefore, fusion in genes not covered by this test would not be reported. For novel fusions detected in this test, Sanger sequencing confirmation is recommended if residue specimen is available

### **NEXT-GENERATION SEQUENCING (NGS) METHODS**

Extracted genomic DNA was amplified using primers targeting coding exons of analyzed genes and subjected to library construction. Barcoded libraries were subsequently conjugated with sequencing beads by emulsion PCR and enriched using Ion Chef system. Sequencing was performed according to Ion Proton or Ion S5 sequencer protocol (Thermo Fisher Scientific).

Raw reads generated by the sequencer were mapped to the hg19 reference genome using the Ion Torrent Suite. Coverage depth was calculated using Torrent Coverage Analysis plug-in. Single nucleotide variants (SNVs) and short insertions/deletions (InDels) were identified using the Torrent Variant Caller plug-in. VEP (Variant Effect Predictor) was used to annotate every variant using databases from Clinvar, COSMIC and Genome Aggregation database. Variants with coverage ≥ 20, allele frequency ≥ 5% and actionable variants with allele frequency ≥ 2% were retained. This test provides uniform coverage of the targeted regions, enabling target base coverage at 100x ≥ 85% with a mean coverage ≥ 500x.

Variants reported in Genome Aggregation database with > 1% minor allele frequency (MAF) were considered as polymorphisms. ACT Genomics in-house database was used to determine technical errors. Clinically actionable and biologically significant variants were determined based on the published medical literature.

The copy number alterations (CNAs) were predicted as described below:

Amplicons with read counts in the lowest 5th percentile of all detectable amplicons and amplicons with a coefficient of variation ≥ 0.3 were removed. The remaining amplicons were normalized to correct the pool design bias. ONCOCNV (an established method for calculating copy number aberrations in amplicon sequencing data by Boeva et al., 2014) was applied for the normalization of total amplicon number, amplicon GC content, amplicon length, and technology-related biases, followed by segmenting the sample with a gene-aware model. The method was used as well for establishing the baseline of copy number variations.

Tumor mutational burden (TMB) was calculated by using the sequenced regions of ACTOnco®+ to estimate the number of somatic nonsynonymous mutations per megabase of all protein-coding genes (whole exome). The TMB calculation predicted somatic variants and applied a machine learning model with a cancer hotspot correction. TMB may be reported as "TMB-High", "TMB-Low" or "Cannot Be Determined". TMB-High corresponds to ≥ 7.5 mutations per megabase (Muts/Mb); TMB-Low corresponds to < 7.5 Muts/Mb. TMB is reported as "Cannot Be Determined" if the tumor purity of the sample is < 30%.

Classification of microsatellite instability (MSI) status is determined by a machine learning prediction algorithm. The change of a number of repeats of different lengths from a pooled microsatellite stable (MSS) baseline in > 400 genomic loci are used as the features for the algorithm. The final output of the results is either microsatellite Stable (MSS) or microsatellite instability high (MSI-H).

## ACTOnco® + Report

#### **RNA** test

Extracted RNA was reverse-transcribed and subjected to library construction. Sequencing was performed according to lon Proton or lon S5 sequencer protocol (Thermo Fisher Scientific). To ensure sequencing quality for fusion variant analysis, the average unique RNA Start Sites (SS) per control Gene Specific Primer 2 (GSP 2) should be ≥ 10.

The fusion analysis pipeline aligned sequenced reads to the human reference genome, identified regions that map to noncontiguous regions of the genome, applied filters to exclude probable false-positive events and, annotated previously characterized fusion events according to Quiver Gene Fusion Database, a curated database owned and maintained by ArcherDX. In general, samples with detectable fusions need to meet the following criteria: (1) Number of unique start sites (SS) for the GSP2  $\geq$  3; (2) Number of supporting reads spanning the fusion junction  $\geq$  5; (3) Percentage of supporting reads spanning the fusion junction  $\geq$  10%; (4) Fusions annotated in Quiver Gene Fusion Database.

## **DATABASE USED**

- Reference genome: Human genome sequence hg19
- COSMIC v.92
- Genome Aggregation database r2.1.1
- ClinVar (version 20210404)
- ACT Genomics in-house database
- Quiver Gene Fusion Database version 5.1.18

## **DISCLAIMER**

#### 法律聲明

本檢驗報告僅提供專業醫療參考,結果需經專業醫師解釋及判讀。基因突變資訊非必具備藥物或治療有效性指標,反之亦然。本檢驗報 告提供之用藥指引不聲明或保證其臨床有效性,反之亦然。本基因檢測方法係由本公司研究開發,已經過有效性測試。

本檢驗報告非經本公司許可,不得私自變造、塗改,或以任何方式作為廣告及其他宣傳之用途。

本公司於提供檢驗報告後,即已完成本次契約義務,後續之報告解釋、判讀及用藥、治療,應自行尋求相關專業醫師協助,若需將報告移件其他醫師,本人應取得該醫師同意並填寫移件申請書,主動告知行動基因,行動基因僅能配合該醫師意願與時間提供醫師解說。

#### 醫療決策需由醫師決定

任何治療與用藥需經由醫師在考慮病患所有健康狀況相關資訊包含健檢、其他檢測報告和病患意願後,依照該地區醫療照護標準由醫師獨立判斷。醫師不應僅依據單一報告結果(例如本檢測或本報告書內容)做決策。

## 基因突變與用藥資訊並非依照有效性排序

本報告中列出之生物標記變異與藥物資訊並非依照潛在治療有效性排序。

#### 證據等級

藥物潛在臨床效益(或缺乏潛在臨床效益)的實證證據是依據至少一篇臨床療效個案報告或臨床前試驗做為評估。本公司盡力提供適時及 準確之資料,但由於醫學科技之發展日新月異,本公司不就本報告提供的資料是否為準確、適宜或最新作保證。

#### 責任

本檢驗報告僅提供專業醫療參考,本公司及其員工不對任何由使用本報告之內容引起的直接、間接、特殊、連帶或衍生的損失或損害承擔責任。

行動基因僅提供技術檢測服務及檢測報告,檢測結果之臨床解釋及相關醫療處置,請諮詢專業醫師。報告結果僅對此試驗件有效。 行動基因臨床分子醫學實驗室 台北市內湖區新湖二路345號3F
