Date received: Dec 21, 2022 Lab ID: AA-22-07762	D/ID: NA

ABOUT ACTORCO®4

The test is a next-generation sequencing (NGS)-based assay developed for efficient and comprehensive genomic profiling of cancers. This test interrogates coding regions of 440 genes associated with cancer treatment, prognosis and diagnosis. Genetic mutations detected by this test include small-scale mutations like single nucleotide variants (SNVs), small insertions and deletions (InDels) (≤ 15 nucleotides) and large-scale genomic alterations like copy number alterations (CNAs). The test also includes an RNA test, detecting fusion transcripts of 13 genes.

SUMMARY FOR ACTIONABLE VARIANTS VARIANTS/BIOMARKERS WITH EVIDENCE OF CLINICAL SIGNIFICANCE

Genomic Probable Effects in Patient's Cancer Type Probable Sensitive in Other Alterations/Biomarkers Sensitive Resistant Cancer Types Not detected

VARIANTS/BIOMARKERS WITH POTENTIAL CLINICAL SIGNIFICANCE

Genomic Alterations/Biomarkers	Possibly Sensitive	Possibly Resistant
ATRX K2261*	Olaparib, Talazoparib	-
RB1 K153*	-	Abemaciclib, Palbociclib, Ribociclib

Note:

- The above summary tables present genomic variants and biomarkers based on the three-tiered approach proposed by US FDA for reporting tumor profiling NGS testing. "Variants/biomarkers with evidence of clinical significance" refers to mutations that are widely recognized as standard-of-care biomarkers (FDA level 2/AMP tier 1). "Variants/biomarkers with potential clinical significance" refers to mutations that are not included in the standard of care but are informational for clinicians, which are commonly biomarkers used as inclusion criterial for clinical trials (FDA level 3/AMP tier 2).
- The therapeutic agents and possible effects to a given drug are based on mapping the variants/biomarkers with ACT Genomics clinical knowledge database. The mapping results only provide information for reference, but not medical recommendation.
- Please refer to corresponding sections for more detailed information about genomic alteration and clinical relevance listed above.

ACTOnco® + Report

TESTING RESULTS

VARIANT(S) WITH CLINICAL RELEVANCE

- Single Nucleotide and Small InDel Variants

Gene	Amino Acid Change	Allele Frequency
ATRX	K2261*	93.4%
RB1	K153*	95.8%
TP53	S127P	84.8%

- Copy Number Alterations

Chromosome	Chromosome Gene Variatio		Copy Number
Chr22	CHEK2, NF2	Heterozygous deletion	1
Chr4	FBXW7	Heterozygous deletion	1

- Fusions

Fusion Gene & Exon	Transcript ID
	No fusion gene detected in this sample

- Immune Checkpoint Inhibitor (ICI) Related Biomarkers

Biomarker	Results
Tumor Mutational Burden (TMB)	3.8 muts/Mb
Microsatellite Instability (MSI)	Microsatellite stable (MSS)

Note:

- Variant(s) enlisted in the SNV table may currently exhibit no relevance to treatment response prediction. Please refer to INTERPRETATION for more biological information and/or potential clinical impacts of the variants.
- Loss of heterozygosity (LOH) information was used to infer tumor cellularity. Copy number alteration in the tumor was determined based on 91% tumor purity.
- For more therapeutic agents which are possibly respond to heterozygous deletion of genes listed above, please refer to APPENDIX for more information.
- TMB was calculated by using the sequenced regions of ACTOnco®+ to estimate the number of somatic nonsynonymous mutations per megabase of all protein-coding genes (whole exome). The threshold for high mutation load is set at ≥ 7.5 mutations per megabase. TMB, microsatellite status and gene copy number deletion cannot be determined if calculated tumor purity is < 30%.

ACTOnco® + Report

THERAPEUTIC IMPLICATIONS

TARGETED THERAPIES

Genomic Alterations	Therapies	Effect	
Level 3B			
ATRX K2261*	Olaparib	sensitive	
Level 4			
ATRX K2261*	Talazoparib	sensitive	
RB1 K153*	Abemaciclib, Palbociclib, Ribociclib	resistant	

Therapies associated with benefit or lack of benefit are based on biomarkers detected in this tumor and published evidence in professional guidelines or peer-reviewed journals.

Level	Description
1	FDA-recognized biomarkers predictive of response or resistance to FDA approved drugs in this indication
2	Standard care biomarkers (recommended by the NCCN guideline) predictive of response or resistance to FDA approved drugs in this indication
3A	Biomarkers predictive of response or resistance to therapies approved by the FDA or NCCN guideline in a different cancer type
3B	Biomarkers that serve as inclusion criteria for clinical trials (minimal supportive data required)
4	Biomarkers that show plausible therapeutic significance based on small studies, few case reports, or preclinical studies

行動基因僅提供技術檢測服務及檢測報告,檢測結果之臨床解釋及相關醫療處置,請諮詢專業醫師。報告結果僅對此試驗件有效。 行動基因臨床分子醫學實驗室 台北市內湖區新湖二路345號3F Email: service@actgenomics.com T: +886-2-2795-3660 F: +886-2-2795-5016

ACTOnco® + Report

IMMUNE CHECKPOINT INHIBITORS (ICIs)

No genomic alterations detected to confer sensitivity or lack of benefit to immune checkpoint therapies.

- Other Biomarkers with Potential Clinical Effects for ICIs

Genomic Alterations	Potential Clinical Effects
N	

Note: Tumor non-genomic factors, such as patient germline genetics, PDL1 expression, tumor microenvironment, epigenetic alterations or other factors not provided by this test may affect ICI response.

CHEMOTHERAPIES

Genomic Alterations	Therapies	Effect	Level of Evidence	Cancer Type
DD4	Cisplatin	Sensitive	Clinical	Bladder carcinoma
RB1 K153*	FAC, T/FAC, taxane/doxorubicin	Sensitive	Clinical	Breast cancer

HORMONAL THERAPIES

Genomic Alterations	Therapies	Effect	Level of Evidence	Cancer Type
RB1	Tomovifon	Decistant	Clinical	Droot concer
K153*	Tamoxifen	Resistant	Clinical	Breast cancer

OTHERS

Pharmacogenomic implication

Gene	Detection Site	Genotype	Drug Impact	Level of Evidence*
UGT1A1	rs4148323	AG	Irinotecan-based regimens	Level 1B

Clinical Interpretation:

Patients with the AG genotype and cancer who are treated with irinotecan-based regimens may have an increased risk of diarrhea and neutropenia as compared to patients with the GG genotype, or a decreased risk of diarrhea and neutropenia compared to patients with the AA genotype. Other genetic and clinical factors may also influence a patient's risk of diarrhea and neutropenia.

Level 1A: Clinical annotations describe variant-drug combinations that have variant-specific prescribing guidance available in a current clinical guideline annotation or an FDA-approved drug label annotation.

Level 1B: Clinical annotations describe variant-drug combinations with a high level of evidence supporting the association but no variant-specific prescribing guidance in an annotated clinical guideline or FDA drug label.

Level 2A: Variants in Level 2A clinical annotations are found in PharmGKB's Tier 1 Very Important Pharmacogenes (VIPs). These variants are in known pharmacogenes, implying causation of drug phenotype is more likely.

Note:

Therapeutic implications provided in the test are based solely on the panel of 440 genes sequenced. Therefore, alterations in genes not covered in this panel, epigenetic and post-transcriptional and post-translational factors may also determine a patient's response to therapies. In addition, several other patient-associated clinical factors, including but not limited to, prior lines of therapies received, dosage and combinations with other therapeutic agents, patient's cancer types, sub-types, and/or stages, may also determine the patient's clinical response to therapies.

VARIANT INTERPRETATION

ATRX K2261*

Biological Impact

The alpha thalassemia/mental retardation syndrome X-linked (ATRX) gene encodes a tumor suppressor and member of the SWI1/SNF2 family of helicase/adenosine triphosphatase (ATPase) involved in chromatin remodeling [1][2]. ATRX mutations are associated with chromosomal instability and are hence implicated in oncogenesis [3]. Mutations in the ATRX gene cause alpha thalassemia/ mental retardation X-linked syndrome [4].

K2261* mutation results in a premature truncation of the ATRX protein at amino acid 2261 (UniProtKB). This mutation is predicted to lead to a loss of ATRX function, despite not having characterized in the literature.

Therapeutic and prognostic relevance

ATRX has been determined as an inclusion criterion for the trials evaluating olaparib efficacy in metastatic/advanced urothelial carcinoma (NCT03375307) and ovarian cancer^[5], niraparib efficacy in melanoma (NCT03925350), and rucaparib efficacy in ovarian cancer^[6]. In a preclinical study, immortalized astrocytes with loss of ATRX were sensitive to olaparib and talazoparib treatment in vitro^[7].

A retrospective study of patients with glioma showed that those with loss of ATRX expression showed increased overall survival compared to those with retained ATRX expression (p < 0.0001)^[8]. However, loss of ATRX or DAXX expression in uterine leiomyosarcoma and mutations in the DAXX/ATRX genes in Chinese patients with pancreatic neuroendocrine tumors are correlated with poor overall survival^{[9][10]}, and progression-free survival^[10].

RB1 K153*

Biological Impact

The Retinoblastoma (RB1) gene encodes a tumor suppressor that negatively regulates the cell cycle, cell division, and DNA replication^[11]. Loss-of-function RB1 could lead to unregulated cell division and growth, abrogation of multiple mechanisms that safeguard against cellular transformation, and tumorigenesis^[12]. RB1 has also been implicated as a haploinsufficient tumor suppressor with one copy loss may lead to weak protein expression and is insufficient to execute its original physiological functions^{[13][14][15]}. Deletion or inactivating mutation of RB1 is found in a number of tumors, including lung, prostate, bladder, breast cancers and sarcomas. RB1 mutations are found in approximately half of all retinoblastoma cases^[16].

K153* mutation results in a premature truncation of the RB1 protein at amino acid 153 (UniProtKB). This mutation is predicted to lead to a loss of RB1 function, despite not having characterized in the literature.

Therapeutic and prognostic relevance

A deleterious mutation in one or more of the three DNA repair genes ATM, RB1, and FANCC predicted pathologic response and better overall survival to cisplatin-based chemotherapy for muscle-invasive bladder cancer patients^[17]. High RB loss was found to be associated with improved pathologic clinical response in breast cancer patients treated with 5-fluorouracil/adriamycin/cytoxan (FAC), T/FAC, and Taxane/Adriamycin neoadjuvant therapy^[18].

Clinical and experimental data suggested that a non-functional retinoblastoma pathway is associated with resistance to tamoxifen in breast cancer^{[19][20]}.

Acquired RB1 mutations were found in hormone receptor positive breast cancer patients who developed resistance to palbociclib or ribociclib treatment^[21]. Preclinical data also showed that knockdown of RB1 would impair antitumor activity of CDK4/6 inhibitor, abemaciclib^[22].

Project ID: C22-M001-03850 Report No.: AA-22-07762_ONC Date Reported: Dec 30, 2022

ACTOnco® + Report

Two large-scale genome-sequencing projects have identified a high prevalence of mutations in TP53 and RB1 in small cell lung cancer (SCLC)^{[23][24]}. Analyses of repeat biopsy samples from patients with EGFR-mutant adenocarcinoma that had transformed to the SCLC subtype have revealed that 100% of these patients have loss of RB1 and may be the alteration that induces this non-small-cell to small-cell transformation^{[20][25]}.

TP53 S127P

Biological Impact

TP53 encodes the p53 protein, a crucial tumor suppressor that orchestrates essential cellular processes including cell cycle arrest, senescence and apoptosis^[26]. TP53 is a proto-typical haploinsufficient gene, such that loss of a single copy of TP53 can result in tumor formation^[27].

Therapeutic and prognostic relevance

Despite having a high mutation rate in cancers, there are currently no approved targeted therapies for TP53 mutations. A phase II trial demonstrated that Wee1 inhibitor (AZD1775) in combination with carboplatin was well tolerated and showed promising anti-tumor activity in TP53-mutated ovarian cancer refractory or resistant (< 3 months) to standard first-line therapy (NCT01164995)^[28].

In a retrospective study (n=19), advanced sarcoma patients with TP53 loss-of-function mutations displayed improved progression-free survival (208 days versus 136 days) relative to patients with wild-type TP53 when treated with pazopanib^[29]. Results from another Phase I trial of advanced solid tumors (n=78) demonstrated that TP53 hotspot mutations are associated with better clinical response to the combination of pazopanib and vorinostat^[30].

Advanced solid tumor and colorectal cancer patients harboring a TP53 mutation have been shown to be more sensitive to bevacizumab when compared with patients harboring wild-type TP53^{[31][32][33]}. In a pilot trial (n=21), TP53-negative breast cancer patients demonstrated increased survival following treatment with bevacizumab in combination with chemotherapy agents, Adriamycin (doxorubicin) and Taxotere (docetaxel)^[34]. TP53 mutations were correlated with poor survival of advanced breast cancer patients receiving tamoxifen or primary chemotherapy^{[35][36]}. In a retrospective study of non-small cell lung cancer (NSCLC), TP53 mutations were associated with high expression of VEGF-A, the primary target of bevacizumab, offering a mechanistic explanation for why patients exhibit improved outcomes after bevacizumab treatment when their tumors harbor mutant TP53 versus wild-type TP53^[37].

CHEK2 Heterozygous deletion

Biological Impact

The checkpoint kinase 2 (CHEK2 or CHK2) gene encodes a serine/threonine protein kinase involved in transducing DNA damage signals that are required for both the intra-S phase and G2/M checkpoints^[38]. CHEK2 heterozygosity has been shown to cause haploinsufficient phenotypes that can contribute to tumorigenesis through inappropriate S phase entry, accumulation of DNA damage during replication, and failure to restrain mitotic entry^{[39][40]}. CHEK2 aberrations are associated with glioblastoma, breast, ovarian, prostate, colorectal, gastric, thyroid, and lung cancers^{[41][42][43][44][45]}.

Therapeutic and prognostic relevance

In May 2020, the U.S. FDA approved olaparib for the treatment of adult patients with metastatic castration-resistant prostate cancer (mCRPC) who carry mutations in homologous recombination repair (HRR) genes, including BRCA1, BRCA2, ATM, BARD1, BRIP1, CDK12, CHEK1, CHEK2, FANCL, PALB2, RAD51B, RAD51C, RAD51D, RAD54L, and progressed following prior treatment with enzalutamide or abiraterone acetate (NCT02987543)^[46].

In a phase II trial (TBCRC 048; NCT03344965), 7 metastatic breast cancer patients harboring only germline mutations in CHEK2 were not responded to olaparib treatment (SD: n=3, PD: n=4)^[47]. Furthermore, in another phase II trial (TRITON2; NCT02952534), 12 mCRPC patients harboring CHEK2 alteration had limited response to rucaparib

treatment. One patient with co-occurring ATM alteration had a radiographic partial response (n=1/9 evaluable patients). The prostate-specific antigen response rate was 16.7% (n=2/12), and the 6-month clinical benefit rate was 37.5% $(n=3/8)^{[48]}$.

In addition, CHEK2 has been determined as an inclusion criterion for the trials evaluating olaparib efficacy in advanced solid tumors (NCT03297606; CAPTUR trial), rucaparib efficacy in ovarian cancer (NCT01968213)[6], and prostate cancer (NCT02952534, NCT03533946)[48], niraparib efficacy in metastatic esophageal/gastroesophageal junction (GEJ)/proximal gastric adenocarcinoma (NCT03840967), melanoma (NCT03925350), pancreatic cancer (NCT03553004, NCT03601923), prostate cancer (NCT02854436), and any malignancy, except prostate (NCT03207347), and talazoparib efficacy in HER2-negative solid tumors (NCT02401347), prostate cancer (NCT03148795), and lung cancer (NCT03377556), respectively.

FBXW7 Heterozygous deletion

Biological Impact

The F-box/WD repeat-containing protein 7 (FBXW7) gene encodes a protein that belongs to the SCF (SKP1-CUL1-Fbox protein) E3 ligase complex. FBXW7 is recognized as a tumor suppressor which is involved in the negative regulation of oncogenes such as c-Myc^{[49][50]}, c-Jun^[51], cyclin E^[52], Notch family members^{[53][54]}, Aurora-A^[55], mTOR^[56], KLF5[57], and MCL-1[58]. Inactivating FBXW7 mutation or copy number loss may result in the accumulation of oncoproteins and therefore lead to malignant transformation[59]. FBXW7 is a haploinsufficient tumor suppressor gene with one copy loss may lead to weak protein expression and is insufficient to execute its original physiological functions^{[57][58][60]}

Therapeutic and prognostic relevance

Clinical efficacy of mTOR inhibitors was seen in patients harboring aberrations in the FBXW7 gene (one patient with refractory fibrolamellar hepatocellular carcinoma, and one patient with lung adenocarcinoma)[61][62]. Moreover, in vitro assay also suggested that loss or inactivation of FBXW7 may confer sensitivity to mTOR inhibitor[56].

Preclinical studies suggested that mutations or loss of FBXW7 were associated with regorafenib and oxaliplatin resistance in CRC cell lines and gefitinib resistance in lung cancer cells[63][64][65][66].

Retrospective studies have indicated that a relatively low expression level of FBXW7 is an independent prognostic marker of poor survival for patients with hepatocellular carcinoma, lung adenocarcinoma and squamous cell carcinoma^{[67][65]}.

NF2 Heterozygous deletion

Biological Impact

The neurofibromin (NF2) gene encodes the protein Merlin, a tumor suppressor that functions as a negative regulator of the PI3K/AKT/mTOR pathway[68][69][70]. NF2 is a haploinsufficient tumor suppressor gene with one copy loss may lead to weak protein expression and is insufficient to execute its original physiological functions^[71]. Inactivation germline mutations in the NF2 are associated with the hereditary neurofibromatosis type 2, a disorder characterized by the growth of noncancerous tumors in the nervous system[68][72]. Somatic mutations or deletion of NF2 are frequently observed in human cancers, including 20-50% of pleural mesotheliomas[73], 6% papillary renal cell carcinoma, 5% pancreas cancer, and 4% melanoma (cbioPortal; June 2015), and less frequently in other cancers[74].

Therapeutic and prognostic relevance

Genomic alterations with activating effects on the mTOR signaling pathway have been identified to confer sensitivity to everolimus across multiple cancer types[75][76][77][78]. There are at least two case studies indicating the clinical efficacy of everolimus in bladder cancer and urothelial carcinoma[79][80], both harboring NF2 truncating mutations. Preclinical

US FDA-APPROVED DRUG(S)

Everolimus (AFINITOR)

Everolimus, a derivative of sirolimus, works as an inhibitor of mammalian target of rapamycin complex 1 (mTORC1) and blocks mTORC1-mediated downstream signals for cell growth, proliferation, and survival. Everolimus is developed and marketed by Novartis under the trade name AFINITOR.

- FDA Approval Summary of Everolimus (AFINITOR)

RADIANT-4 ^[83]	Lung or gastrointestinal neuroendocrine tumor (Approved on 2016/02/26)
NCT01524783	
NC101324763	Everolimus vs. Placebo [PFS(M): 11 vs. 3.9]
BOLERO-2 ^[84]	Breast cancer (Approved on 2012/07/20)
NCT00863655	ER+/HER2-
NC10000000	Everolimus + exemestane vs. Placebo + exemestane [PFS(M): 7.8 vs. 3.2]
EXIST-2	Tuberous sclerosis complex (tsc)-associated renal angiomyolipoma (Approved on 2012/04/26)
NCT00790400	
	Everolimus vs. Placebo [ORR(%): 41.8 vs. 0]
DADIANT 0[85]	Pancreatic neuroendocrine tumor (Approved on 2011/05/05)
RADIANT-3 ^[85]	-
NCT00510068	Everolimus vs. Placebo [PFS(M): 11 vs. 4.6]
EXIST-1 ^[86]	Subependymal giant cell astrocytoma (Approved on 2010/10/29)
NCT00789828	-
NC100709020	Everolimus vs. Placebo [ORR(%): 35.0]
DECORD 4[87]	Renal cell carcinoma (Approved on 2009/05/30)
RECORD-1 ^[87]	-
NCT00410124	Everolimus vs. Placebo [PFS(M): 4.9 vs. 1.9]

Niraparib (ZEJULA)

Niraparib is an oral, small molecule inhibitor of the DNA repair enzyme poly (ADP-ribose) polymerase-1 and -2 (PARP-1, -2). Niraparib is developed and marketed by Tesaro under the trade name ZEJULA.

- FDA Approval Summary of Niraparib (ZEJULA)

DDIMA	Ovarian cancer, Fallopian tube cancer, Peritoneal carcinoma (Approved on 2020/04/29)
PRIMA	-
NCT02655016	Niraparib vs. Placebo [PFS (overall population)(M): 13.8 vs. 8.2]
1881	Ovarian cancer, Fallopian tube cancer, Peritoneal carcinoma (Approved on 2017/03/27)
NOVA ^[88]	
NCT01847274	Niraparib vs. Placebo [PFS (overall population)(M): 11.3 vs. 4.7]

NCT01874353	gBRCA mutation						
NC101074333	Olaparib vs. Placebo [PFS(M): 19.1 vs. 5.5]						
C4d40[94]	Ovarian cancer, Fallopian tube cancer, Peritoneal carcinoma (Approved on 2017/08/17)						
Study19 ^[94] NCT00753545	-						
ING 100733343	Olaparib vs. Placebo [PFS(M): 8.4 vs. 4.8]						

Rucaparib (RUBRACA)

Rucaparib is an inhibitor of the DNA repair enzyme poly (ADP-ribose) polymerase-1, -2 and -3 (PARP-1, -2, -3). Rucaparib is developed and marketed by Clovis Oncology under the trade name RUBRACA.

- FDA Approval Summary of Rucaparib (RUBRACA)

TRITONO	Prostate cancer (Approved on 2020/05/15)
TRITON2 NCT02952534	gBRCA mutation or sBRCA mutation
NC102952554	Rucaparib [ORR(%): 44.0, DOR(M): NE]
	Ovarian cancer, Fallopian tube cancer, Peritoneal carcinoma (Approved on 2018/04/06)
ARIEL3 ^[6]	
NCT01968213	Rucaparib vs. Placebo [PFS (All)(M): 10.8 vs. 5.4, PFS (HRD)(M): 13.6 vs. 5.4, PFS
	(tBRCA)(M): 16.6 vs. 5.4]

ACTOnco® + Report

Talazoparib (TALZENNA)

Talazoparib is an inhibitor of poly (ADP-ribose) polymerase (PARP) enzymes, including PARP1 and PARP2. Talazoparib is developed and marketed by Pfizer under the trade name TALZENNA.

- FDA Approval Summary of Talazoparib (TALZENNA)

EMBRACA ^[95]	Breast cancer (Approved on 2018/10/16)
	HER2-/gBRCA mutation
NCT01945775	Talazoparib vs. Chemotherapy [PFS(M): 8.6 vs. 5.6]

Temsirolimus (TORISEL)

Temsirolimus is a soluble ester of sirolimus (rapamycin, brand-name drug Rapamune) and functions as an inhibitor of mammalian target of rapamycin complex (mTORC). The inhibitory molecular mechanism is similar to Everolimus. Temsirolimus is developed by Wyeth Pharmaceuticals and marketed by Pfizer under the trade name TORISEL.

- FDA Approval Summary of Temsirolimus (TORISEL)

[96]	Renal cell carcinoma (Approved on 2007/05/30)
NCT00065468	-
NC 100065468	Temsirolimus vs. Ifn-α [OS(M): 10.9 vs. 7.3]

Note:

- This table enlists variants detected by the panel other than those with clinical relevance (reported in Testing Result section). The clinical impact of a genetic variant is determined according to ACT Genomics in-house clinical knowledge database. A negative result does not necessarily indicate absence of biological effect on the tumor. Some variants listed here may possibly have preclinical data or may show potential clinical relevance in the future.

Project ID: C22-M001-03850 Report No.: AA-22-07762 ONC

Date Reported: Dec 30, 2022

LIMITATIONS

- This test does not provide information of variant causality and does not detect variants in non-coding regions that could affect gene expression. This report does not report polymorphisms and we do not classify whether a mutation is germline or somatic. Variants identified by this assay were not subject to validation by Sanger or other technologies.
- The possibility cannot be excluded that certain pathogenic variants detected by other sequencing tools may not be reported in the test because of technical limitation of bioinformatics algorithm or the NGS sequencing platform, e.g. low coverage.
- This test has been designed to detect fusions in 13 genes sequenced. Therefore, fusion in genes not covered by this test would not be reported. For novel fusions detected in this test, Sanger sequencing confirmation is recommended if residue specimen is available

NEXT-GENERATION SEQUENCING (NGS) METHODS

Extracted genomic DNA was amplified using primers targeting coding exons of analyzed genes and subjected to library construction. Barcoded libraries were subsequently conjugated with sequencing beads by emulsion PCR and enriched using Ion Chef system. Sequencing was performed according to Ion Proton or Ion S5 sequencer protocol (Thermo Fisher Scientific).

Raw reads generated by the sequencer were mapped to the hg19 reference genome using the Ion Torrent Suite. Coverage depth was calculated using Torrent Coverage Analysis plug-in. Single nucleotide variants (SNVs) and short insertions/deletions (InDels) were identified using the Torrent Variant Caller plug-in. VEP (Variant Effect Predictor) was used to annotate every variant using databases from Clinvar, COSMIC and Genome Aggregation database. Variants with coverage ≥ 20, allele frequency ≥ 5% and actionable variants with allele frequency ≥ 2% were retained. This test provides uniform coverage of the targeted regions, enabling target base coverage at 100x ≥ 85% with a mean coverage ≥ 500x.

Variants reported in Genome Aggregation database with > 1% minor allele frequency (MAF) were considered as polymorphisms. ACT Genomics in-house database was used to determine technical errors. Clinically actionable and biologically significant variants were determined based on the published medical literature.

The copy number alterations (CNAs) were predicted as described below:

Amplicons with read counts in the lowest 5th percentile of all detectable amplicons and amplicons with a coefficient of variation ≥ 0.3 were removed. The remaining amplicons were normalized to correct the pool design bias. ONCOCNV (an established method for calculating copy number aberrations in amplicon sequencing data by Boeva et al., 2014) was applied for the normalization of total amplicon number, amplicon GC content, amplicon length, and technology-related biases, followed by segmenting the sample with a gene-aware model. The method was used as well for establishing the baseline of copy number variations.

Tumor mutational burden (TMB) was calculated by using the sequenced regions of ACTOnco®+ to estimate the number of somatic nonsynonymous mutations per megabase of all protein-coding genes (whole exome). The TMB calculation predicted somatic variants and applied a machine learning model with a cancer hotspot correction. TMB may be reported as "TMB-High", "TMB-Low" or "Cannot Be Determined". TMB-High corresponds to ≥ 7.5 mutations per megabase (Muts/Mb); TMB-Low corresponds to < 7.5 Muts/Mb. TMB is reported as "Cannot Be Determined" if the tumor purity of the sample is < 30%.

Classification of microsatellite instability (MSI) status is determined by a machine learning prediction algorithm. The change of a number of repeats of different lengths from a pooled microsatellite stable (MSS) baseline in > 400 genomic loci are used as the features for the algorithm. The final output of the results is either microsatellite Stable (MSS) or microsatellite instability high (MSI-H).

RNA test

Extracted RNA was reverse-transcribed and subjected to library construction. Sequencing was performed according to lon Proton or Ion S5 sequencer protocol (Thermo Fisher Scientific). To ensure sequencing quality for fusion variant analysis, the average unique RNA Start Sites (SS) per control Gene Specific Primer 2 (GSP 2) should be ≥ 10.

ACTOnco® + Report

The fusion analysis pipeline aligned sequenced reads to the human reference genome, identified regions that map to noncontiguous regions of the genome, applied filters to exclude probable false-positive events and, annotated previously characterized fusion events according to Quiver Gene Fusion Database, a curated database owned and maintained by ArcherDX. In general, samples with detectable fusions need to meet the following criteria: (1) Number of unique start sites (SS) for the GSP2 \geq 3; (2) Number of supporting reads spanning the fusion junction \geq 5; (3) Percentage of supporting reads spanning the fusion junction \geq 10%; (4) Fusions annotated in Quiver Gene Fusion Database.

DATABASE USED

- Reference genome: Human genome sequence hg19
- COSMIC v.92
- Genome Aggregation database r2.1.1
- ClinVar (version 20210404)
- ACT Genomics in-house database
- Quiver Gene Fusion Database version 5.1.18

DISCLAIMER

法律聲明

本檢驗報告僅提供專業醫療參考,結果需經專業醫師解釋及判讀。基因突變資訊非必具備藥物或治療有效性指標,反之亦然。本檢驗報告提供之用藥指引不聲明或保證其臨床有效性,反之亦然。本基因檢測方法係由本公司研究開發,已經過有效性測試。

本檢驗報告非經本公司許可,不得私自變造、塗改,或以任何方式作為廣告及其他宣傳之用途。

本公司於提供檢驗報告後,即已完成本次契約義務,後續之報告解釋、判讀及用藥、治療,應自行尋求相關專業醫師協助,若需將報告移件其他醫師,本人應取得該醫師同意並填寫移件申請書,主動告知行動基因,行動基因僅能配合該醫師意願與時間提供醫師解說。

醫療決策需由醫師決定

任何治療與用藥需經由醫師在考慮病患所有健康狀況相關資訊包含健檢、其他檢測報告和病患意願後,依照該地區醫療照護標準由醫師獨立判斷。醫師不應僅依據單一報告結果(例如本檢測或本報告書內容)做決策。

基因突變與用藥資訊並非依照有效性排序

本報告中列出之生物標記變異與藥物資訊並非依照潛在治療有效性排序。

證據等級

藥物潛在臨床效益(或缺乏潛在臨床效益)的實證證據是依據至少一篇臨床療效個案報告或臨床前試驗做為評估。本公司盡力提供適時及 準確之資料,但由於醫學科技之發展日新月異,本公司不就本報告提供的資料是否為準確、適宜或最新作保證。

責任

本檢驗報告僅提供專業醫療參考,本公司及其員工不對任何由使用本報告之內容引起的直接、間接、特殊、連帶或衍生的損失或損害承擔責任。

行動基因僅提供技術檢測服務及檢測報告,檢測結果之臨床解釋及相關醫療處置,請諮詢專業醫師。報告結果僅對此試驗件有效。 行動基因臨床分子醫學實驗室 台北市內湖區新湖二路345號3F

ACTOnco® + Report

- 19. PMID: 21358261; 2011, Cell Cycle;10(6):956-62
 A non-functional retinoblastoma tumor suppressor (RB) pathway in premenopausal breast cancer is associated with resistance to tamoxifen.
- PMID: 17160137; 2007, J Clin Invest;117(1):218-28
 The retinoblastoma tumor suppressor modifies the therapeutic response of breast cancer.
- 21. PMID: 29236940; 2018, Ann Oncol;29(3):640-645
 Polyclonal RB1 mutations and acquired resistance to CDK 4/6 inhibitors in patients with metastatic breast cancer.
- PMID: 29483214; 2018, Mol Cancer Ther;17(5):897-907
 Preclinical Activity of Abemaciclib Alone or in Combination with Antimitotic and Targeted Therapies in Breast Cancer.
- PMID: 22941188; 2012, Nat Genet;44(10):1104-10
 Integrative genome analyses identify key somatic driver mutations of small-cell lung cancer.
- PMID: 22941189; 2012, Nat Genet;44(10):1111-6
 Comprehensive genomic analysis identifies SOX2 as a frequently amplified gene in small-cell lung cancer.
- PMID: 25846096; 2015, Lancet Oncol;16(4):e165-72
 Transformation from non-small-cell lung cancer to small-cell lung cancer: molecular drivers and cells of origin.
- PMID: 24739573; 2014, Nat Rev Cancer;14(5):359-70
 Unravelling mechanisms of p53-mediated tumour suppression.
- 27. PMID: 21125671; 2011, J Pathol;223(2):137-46 Haplo-insufficiency: a driving force in cancer.
- PMID: 27998224; 2016, J Clin Oncol;34(36):4354-4361
 Phase II Study of WEE1 Inhibitor AZD1775 Plus Carboplatin in Patients With TP53-Mutated Ovarian Cancer Refractory or Resistant to First-Line Therapy Within 3 Months.
- PMID: 26646755; 2016, Ann Oncol;27(3):539-43
 TP53 mutational status is predictive of pazopanib response in advanced sarcomas.
- 30. PMID: 25669829; 2015, Ann Oncol;26(5):1012-8
 Phase I study of pazopanib and vorinostat: a therapeutic approach for inhibiting mutant p53-mediated angiogenesis and facilitating mutant p53 degradation.
- PMID: 27466356; 2016, Mol Cancer Ther;15(10):2475-2485
 TP53 Alterations Correlate with Response to VEGF/VEGFR Inhibitors: Implications for Targeted Therapeutics.
- 32. PMID: 23670029; 2013, Oncotarget;4(5):705-14
 P53 mutations in advanced cancers: clinical characteristics, outcomes, and correlation between progression-free survival and bevacizumabcontaining therapy.
- PMID: 17145525; 2006, Semin Oncol;33(5 Suppl 10):S8-14
 Bevacizumab in combination with chemotherapy: first-line treatment of patients with metastatic colorectal cancer.
- 34. PMID: 21399868; 2011, Int J Oncol;38(5):1445-52 p53, HER2 and tumor cell apoptosis correlate with clinical outcome after neoadjuvant bevacizumab plus chemotherapy in breast cancer.
- PMID: 20549698; 2011, Int J Cancer;128(8):1813-21
 p53 status influences response to tamoxifen but not to fulvestrant in breast cancer cell lines.
- PMID: 10786679; 2000, Cancer Res;60(8):2155-62
 Complete sequencing of TP53 predicts poor response to systemic therapy of advanced breast cancer.
- PMID: 25672981; 2015, Cancer Res;75(7):1187-90
 VEGF-A Expression Correlates with TP53 Mutations in Non-Small Cell Lung Cancer: Implications for Antiangiogenesis Therapy.

ACTOnco® + Report

The Fbw7 tumor suppressor targets KLF5 for ubiquitin-mediated degradation and suppresses breast cell proliferation.

- PMID: 21368833; 2011, Nature;471(7336):104-9
 SCF(FBW7) regulates cellular apoptosis by targeting MCL1 for ubiquitylation and destruction.
- PMID: 18094723; 2008, Nat Rev Cancer;8(2):83-93
 FBW7 ubiquitin ligase: a tumour suppressor at the crossroads of cell division, growth and differentiation.
- 60. PMID: 23032637; 2012, Cancer Inform;11():157-71 Haploinsufficiency of Tumor Suppressor Genes is Driven by the Cumulative Effect of microRNAs, microRNA Binding Site Polymorphisms and microRNA Polymorphisms: An In silico Approach.
- 61. PMID: 24586741; 2014, PLoS One;9(2):e89388
 FBXW7 mutations in patients with advanced cancers: clinical and molecular characteristics and outcomes with mTOR inhibitors.
- 62. PMID: 24360397; 2014, Lung Cancer;83(2):300-1
 Temsirolimus therapy in a patient with lung adenocarcinoma harboring an FBXW7 mutation.
- PMID: 27399335; 2017, Oncogene;36(6):787-796
 FBW7 mutations mediate resistance of colorectal cancer to targeted therapies by blocking Mcl-1 degradation.
- PMID: 25860929; 2015, Oncotarget;6(11):9240-56
 FBXW7-mutated colorectal cancer cells exhibit aberrant expression of phosphorylated-p53 at Serine-15.
- 65. PMID: 29633504; 2018, Mol Oncol;12(6):883-895
 FBXW7 deletion contributes to lung tumor development and confers resistance to gefitinib therapy.
- 66. PMID: 28522751; 2017, Cancer Res;77(13):3527-3539
 Targeting FBW7 as a Strategy to Overcome Resistance to Targeted Therapy in Non-Small Cell Lung Cancer.
- 67. PMID: 24884509; 2014, Mol Cancer;13():110

 Fbxw7 is an independent prognostic marker and induces apoptosis and growth arrest by regulating YAP abundance in hepatocellular carcinoma.
- PMID: 25893302; 2016, Oncogene;35(5):537-48
 Role of Merlin/NF2 inactivation in tumor biology.
- 69. PMID: 19451229; 2009, Mol Cell Biol;29(15):4235-49 Loss of the tumor suppressor gene NF2, encoding merlin, constitutively activates integrin-dependent mTORC1 signaling.
- 70. PMID: 19451225; 2009, Mol Cell Biol;29(15):4250-61
 NF2/merlin is a novel negative regulator of mTOR complex 1, and activation of mTORC1 is associated with meningioma and schwannoma growth.
- PMID: 17655741; 2007, Brain Pathol;17(4):371-6
 Role of NF2 haploinsufficiency in NF2-associated polyneuropathy.
- PMID: 19545378; 2009, Orphanet J Rare Dis;4():16
 Neurofibromatosis type 2 (NF2): a clinical and molecular review.
- 73. PMID: 21642991; 2011, Nat Genet; 43(7):668-72
 The nuclear deubiquitinase BAP1 is commonly inactivated by somatic mutations and 3p21.1 losses in malignant pleural mesothelioma.
- PMID: 24393766; 2014, Oncotarget;5(1):67-77
 NF2/merlin in hereditary neurofibromatosis 2 versus cancer: biologic mechanisms and clinical associations.
- 75. PMID: 27091708; 2016, J Clin Oncol;34(18):2115-24

 Molecular Alterations and Everolimus Efficacy in Human Epidermal Growth Factor Receptor 2-Overexpressing Metastatic Breast Cancers:

 Combined Exploratory Biomarker Analysis From BOLERO-1 and BOLERO-3.

ACTOnco® + Report

76. PMID: 26503204: 2016. J Clin Oncol:34(5):419-26

Correlative Analysis of Genetic Alterations and Everolimus Benefit in Hormone Receptor-Positive, Human Epidermal Growth Factor Receptor 2-Negative Advanced Breast Cancer: Results From BOLERO-2.

77. PMID: 24833916; 2014, Breast Cancer (Dove Med Press);6():43-57

Use of mTOR inhibitors in the treatment of breast cancer: an evaluation of factors that influence patient outcomes.

78. PMID: 26859683; 2016, Oncotarget;7(9):10547-56

Next-generation sequencing reveals somatic mutations that confer exceptional response to everolimus.

79. PMID: 22923433; 2012, Science;338(6104):221

Genome sequencing identifies a basis for everolimus sensitivity.

80. PMID: 25630452; 2015, Eur Urol;67(6):1195-1196

Exceptional Response on Addition of Everolimus to Taxane in Urothelial Carcinoma Bearing an NF2 Mutation.

81. PMID: 26359368; 2015, Cancer Discov;5(11):1178-93

NF2 Loss Promotes Oncogenic RAS-Induced Thyroid Cancers via YAP-Dependent Transactivation of RAS Proteins and Sensitizes Them to MEK Inhibition.

82. PMID: 24813888; 2014, Cell Rep;7(4):999-1008

Acquired resistance of EGFR-mutant lung adenocarcinomas to afatinib plus cetuximab is associated with activation of mTORC1.

83. PMID: 26703889; 2016, Lancet; 387(10022): 968-977

Everolimus for the treatment of advanced, non-functional neuroendocrine tumours of the lung or gastrointestinal tract (RADIANT-4): a randomised, placebo-controlled, phase 3 study.

84. PMID: 22149876; 2012, N Engl J Med;366(6):520-9

Everolimus in postmenopausal hormone-receptor-positive advanced breast cancer.

85. PMID: 21306238; 2011, N Engl J Med;364(6):514-23

Everolimus for advanced pancreatic neuroendocrine tumors.

86. PMID: 23158522; 2013, Lancet; 381(9861):125-32

Efficacy and safety of everolimus for subependymal giant cell astrocytomas associated with tuberous sclerosis complex (EXIST-1): a multicentre, randomised, placebo-controlled phase 3 trial.

87. PMID: 18653228; 2008, Lancet;372(9637):449-56

Efficacy of everolimus in advanced renal cell carcinoma: a double-blind, randomised, placebo-controlled phase III trial.

88. PMID: 27717299; 2016, N Engl J Med;375(22):2154-2164

Niraparib Maintenance Therapy in Platinum-Sensitive, Recurrent Ovarian Cancer.

89. PMID: 31851799; 2019, N Engl J Med;381(25):2416-2428

Olaparib plus Bevacizumab as First-Line Maintenance in Ovarian Cancer.

90. PMID: 31157963; 2019, N Engl J Med;381(4):317-327

Maintenance Olaparib for Germline BRCA-Mutated Metastatic Pancreatic Cancer.

91. PMID: 30345884; 2018, N Engl J Med;379(26):2495-2505

Maintenance Olaparib in Patients with Newly Diagnosed Advanced Ovarian Cancer.

92. PMID: 28578601; 2017, N Engl J Med;377(6):523-533

Olaparib for Metastatic Breast Cancer in Patients with a Germline BRCA Mutation.

93. PMID: 28754483; 2017, Lancet Oncol;18(9):1274-1284

Olaparib tablets as maintenance therapy in patients with platinum-sensitive, relapsed ovarian cancer and a BRCA1/2 mutation (SOLO2/ENGOT-Ov21): a double-blind, randomised, placebo-controlled, phase 3 trial.

94. PMID: 27617661; 2016, Lancet Oncol;17(11):1579-1589
